largest gasfield, with reserves of some 250 trillion cubic feet. Production should hit 5.8 billion cf/d this year and by 1982-83 is scheduled to reach 15.5 billion cf/d—more than the combined production of the Netherlands and Canada last year. Because large-scale development of the Urengoy field is already under way, it would be the easiest field to tap for this project. The Yamburg field, 400 kilometers to the north, also has been mentioned as a possible source of supply for the gas pipeline.

Yamburg gas is earmarked for export. Tapping the undeveloped Yamburg field will be difficult and expensive because of a total lack of infrastructure, more complex permafrost conditions, and a greater distance to markets. It would be easier to expand production at Urengoy by the amount needed for the new pipeline.

The location of the western terminus of the proposed pipeline is also uncertain. The most likely location would be Brest on the Polish-Soviet border. Under this variant, the pipeline might serve Warsaw and Berlin on its way to West Germany, where it would tie in to the West European gas net. A more southerly route through Czechoslovakia is also under consideration, exiting the Soviet Union at Uzhgorod and paralleling existing export lines. The Soviets may be weighing the relative gas needs of the East European countries before making a final route determination. The East European countries through which the pipeline passes reportedly will receive about 1 billion cf/d of the pipeline's throughput as a transit fee.

#### **Technical Factors**

To achieve the desired throughput capacity of 4.8 billion cf/d the pipeline will have to operate at higher pressures than is normal, even in the West. Most Soviet large-diameter pipelines operate at 55 to 75 atmospheres (805 to 1,100 psi) and Western pipelines are only now moving to a pressure of about 100 atmospheres (1,460 psi). The new line calls for a working pressure of 100 to 115 atmospheres (1,460 to 1,680 psi), requiring thicker walled pipe and more powerful compressor stations. Moreover, the gas will have to be cooled where the pipeline crosses permafrost areas both to prevent frost heave, which could rupture

the pipeline, and to prevent melting the surrounding permafrost areas. The Soviets are now building an experimental chilled gas pipeline, but nothing on the scale of the proposed pipeline has ever been tried before.

#### **Equipment Imports and Credit Needs**

Since the USSR does not produce the high-strength, large-diameter pipe or the powerful compressor stations that will be used on the pipeline, it will have to buy nearly all the equipment for the pipeline from Western suppliers. This includes 3.5-4.0 million tons of pipe, 220 ball valve units, and 200 gas turbines.

25X1

25X1

Although Moscow has approached most major suppliers of pipeline equipment for this project, the West Germans have taken the lead in recent negotiations. Mannesmann is bidding to be the major pipe and equipment supplier. A West German press report indicates that the firm also wants to be the general manager for the project and even to take a substantial role in supervising the construction. Deutsche Bank is putting together a syndicate of banks to finance the deal.

25X1

Western companies are eager to supply Moscow's pipe needs for the new line and have ample capacity to do so. The Soviets could have more difficulty lining up compressor suppliers. Moscow may have to turn to US firms, which are the world leaders in compressor design.

. Three 25-

megawatt (MW) (33,000 horsepower) gas turbines will be needed at each of the 41 compressor stations along the line. About 80 turbine compressor units of 10 MW capacity will be required in permafrost areas to cool the gas to 0° Celsius. The total compressor power needed for this project (4,000 to 5,000 MW) will equal about one-third of the entire compressor power the Soviets plan to install in 1981-85.

25X1<sup>√</sup>

We estimate the hard currency equipment costs at \$6 billion: \$3 billion for compressors, \$2 billion for pipe, and another \$1 billion for valves, construction equipment, and other items. This total is roughly one-half the \$11-13 billion estimate generally quoted for the

These agreements permitted the USSR to purchase about 9 million tons of large-diameter pipe and other gas-related equipment, financed by long-term, government-backed credits at low real interest rates. To repay these loans, the USSR agreed to long-term gas

The new deal envisions exports to Western Europe of approximately 3.9 billion cf/d. If the 3.9 billion cf/d figure is agreed upon, the six countries slated to get gas under the pipeline deal would receive the following amounts (in billion cf/d):

West Germany	1.0
France	1.0
Italy	0.7
Belgium	0.6
Netherlands	0.5
Austria	0.3

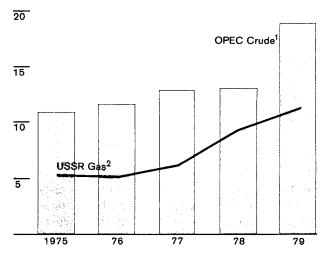

Adding these deliveries to existing contracts—and assuming that the Iranian swap deal does not materialize—Soviet gas deliveries for hard currency in 1990 would reach 6.4 billion cf/d, compared with 2.0 billion cf/d in 1979, and only 0.7 billion cf/d as recently as 1975.

The Soviets should reap a financial bonanza under the new gas deal. Gas prices are expected to soar in the 1980s as exporters seek to close the price gap between gas and liquid fuels. The average price of Soviet gas sold for hard currency in 1979 was equivalent to about \$11 per barrel of crude oil or only about one-third the current oil price. The 1979 gas price was discounted so steeply from crude prices because of the lag built into Soviet gas pricing formulas. Gas prices in 1980 will rise sharply to reflect last year's runup in oil prices. By the time the deliveries through the line begin, most of the gap will have been closed. Moreover, gas earnings should be even greater because crude oil prices should be considerably higher. At the equivalent of current crude oil prices, the 3.9 billion cf/d of new gas exports would earn Moscow \$8 billion a year in hard currency. The earnings would liquidate the hard currency cost for the project in a year or two. even with substantial allowances for inflation and cost overruns for equipment.

The extra gas earnings will go far toward offsetting the projected fall in oil exports in the 1980s. Oil sales of \$9.6 billion accounted for nearly half of the USSR's 1979 hard currency earnings. Gas earnings should rise rapidly through the 1980s because of rapid price increases and some gains in volume under existing contracts. In part because of a decline

### Comparison of Crude Oil and Natural Gas Prices

US \$ per barrel

<sup>1</sup>F.O.B. official sales price.

<sup>2</sup>Cost at national border per barrel of oil equivalent.

25X1

in oil exports, natural gas earnings should overtake oil revenues in the next several years. By the time the new gas project is completed and reaches full capacity—the late 1980s—total scheduled natural gas sales of 6.4 billion cf/d at the equivalent of \$32 per barrel will earn \$13 billion annually. Moreover, the gas revenues would make substantial oil purchases possible. Assuming oil-gas price parity, the income from gas deliveries will be worth 1 million b/d of crude.

25X1

### Western Europe and Soviet Gas Dependency

Western Europe depends on Soviet gas supplies for less than 10 percent of its needs. West European gas production, however, is not increasing as fast as consumption, and it is expected to peak by the mid-1980s because of the decline of the Groningen field in the Netherlands. This field currently supplies more than half of the EC's gas imports. Although increased North Sea production will offset this decline to some extent, gas supplies in Western

25X1

25X1

in doubt several future sources of gas supplies. The trilateral deal with Iran is considered to be a dead issue—removing more than 1.1 billion cf/d from future gas supplies to Western Europe. The Algerians, disappointed with the resistance to their price demands, have stopped construction of the Arzew LNG facility that was to liquefy gas earmarked for West Germany, France, Sweden, Belgium, and the Netherlands. The energy policy in The Hague is directed at preserving domestic gas as a strategic reserve and is designed to extend the life of Dutch gas reserves as long as possible.

#### The Schedule for the Project

The timetable discussed in press articles about the project appears overly optimistic. The participants have stated that they expect construction to be completed by 1983 and the line to be fully operational by 1985-86. We believe that a more realistic schedule would not have the line operating at full capacity before the late 1980s. Planning is still in a preliminary stage, with many basic decisions yet to be made. The technical specifications, pipeline route, and construction arrangements are fundamental questions requiring Soviet decisions. While it seems certain that the project will receive Moscow's full approval, if it has not already, the unresolved questions will require wide coordination among several Soviet ministries.

25X1

<sup>&</sup>lt;sup>2</sup> Assumes capacity deliveries from the pipeline project. Gas consumption in 1990 based on individual country forecasts to the International Energy Agency. Does not include Soviet shipments under defunct swap arrangement with Iran.

Once the pipeline details are firmed up within the Soviet bureaucracy, specific negotiations with the Western firms can move ahead. Although both sides appear eager to see the deal through, the technical, commercial, and financial negotiations promise to be arduous and lengthy. The scale and technical complexity of the pipeline will require Western firms to surpass past achievements. The commercial negotiations could take years if past Soviet negotiating practices are repeated. The Soviets are notoriously tough and laborious bargainers, especially on big contracts.

25X1

A West European consortium of state-owned gas suppliers is being put together to arrange the large gas purchase. Firms expected to be involved include: OEMV (Austria), Gaz de France, Gusunie (Netherlands), Distrigaz (Belgium), ENI (Italy), and several West German firms—Ruhrgas, Thyssen Gas, Deutsche BP, and BEB, an oil and gas company owned jointly by Shell and Esso. These gas firms can expect a hard Soviet line in gas price negotiations. The Soviets already have hinted that they want a formula based on lighter grades of liquid fuels instead of the cheaper residual fuel oil to which most existing gas contracts are linked.

25X1

The West European governments will have to approve the project. The credit amounts required are too great for commercial banks to lend without the explicit backing of their governments. The current amount of West German guarantees, for example, is \$4.9 billion; the gas project will require a substantial increase in commitments that will need legislative approval. Some of the likely equipment and steel suppliers are at least in part government owned. The governments generally favor the project, but bureaucratic delays in approval are possible.
