SECURITY DATA PROCESSING

ACTION COMPONENT(S):

OCS, OS

USER COMPONENT(S):

OS

OBJECTIVES:

The objectives of this project are: a) to provide rapid automatic search of a large index to dossiers of interest to the Office of Security, including maintenance and search of the file from remote devices on an on-line system and b) to provide ADP support to other day-to-day Office of Security activities.
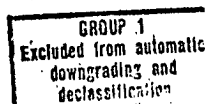

DESCRIPTION:

The complete index to the Office of Security dossier file has been automated. The file contains approximately 1.7 million names and is searched daily for 1,500-2,000 name checks. The file is now searched once daily in a batch mode and updated using the same techniques. Redesign of this system is now under way to provide for search of this file through remote devices in the Office of Security with data on file in a time-sharing system in OCS. When this is accomplished the need for manual files in the Office of Security should be eliminated. Other security files are processed as well: reports on case processing statistics and status, special clearance status, applicant processing and badge information. This system now interfaces with the name check activity in DDP so that cases of interest to the Clandestine Services can be searched in the Office of Security files as well. An additional interface with similar activities at Fort Holabird is provided through a data communications link.
