ANTENNA

MANUAL

PROPOSAL

WASHINGTON, D. C.

25X1

### RESTATEMENT OF THE PROBLEM AND OBJECTIVE

The end product of the proposed project is a manual for use by instructors to train non-technical people in the field of antennas and radiation. The manual will include a brief discussion of the theory of simple antennas as related to propagation, a discussion of non-directional and directional antennas, makeshift antennas, direction finding, concealment, and construction information. The handbook will be practical as opposed to theoretical and will be written at the level of personnel with only a minimum knowledge of communications.

While primary emphasis in the manual will be on construction and orientation, the contractor believes that a very limited discussion of antenna and propagation background will be necessary as introduction to the material on types of antennas and construction thereof.

#### ORGANIZATION

The pr	oject will be broken into	three basic phases.	Phase	
A will be a	study and planning phase.	The antenna review	and in-	
vestigation	will be conducted in conj	unction with the pla	nning for	
work under	Phases B and C.	will be	in.	25 <b>X</b> 1
general sup	ervision of the work calle	ed for under this pha	se. Frank	
т.	Jr. will assist	in the planning of	Phase B.	25 <b>X</b> 1
Phase	B will involve ascertaining	ng data on makeshift	antennas	
and measure	ment of radiation efficien	cies of simple direc	ction al	
and non-dir	ectional antennas under ad	lverse use conditions	<b>.</b>	
wi	ll assume general supervis	sion and coordination	of work.	25X1

under	this pha	ıse.	will	supervise	the :	laboratory	25X1
work.							

phase C will involve the correlation and editing of material and data from Phases A and B, culminating in the writing of the antenna manual and preparation of exhibits.

Close liaison will be maintained with the contracting agency throughout the project. It will be necessary to make use of the background material available at the congracting agency for particular problems such as operational techniques, methods, DF methods, etc. This information will be required either for inclusion in the book or as reference material for making decisions regarding types of antennas to be used and methods for their use.

# METHOD OF APPROACH

The basic requirement called for in contracting agency's specification number 56-A-1055-A is a simplified manual describing antenna construction. Paralleling this basic requirement is the need for an investigation of numerous antennas culminating in a choice of a few to be included in the manual. Also required is material in the manual discussing the use of the particular antennas to permit instruction in the choice of and location of antennas under varied conditions.

A preliminary outline of sections to the manual follows.

-2-CONTINUE SECRET 25X1

WASHINGTON D. C. N A 25X1

- I Basic Propagation Discussion
  - A. Ground Wave
  - B. Sky Wave
  - C. Skip Distance
  - D. Day and Night Conditions
  - E. Effect of Frequency
  - F. Polarization of Wave
- II Fundamental Antenna Discussion
  - A. Definition
  - B. Matching
  - C. Grounding
  - D. Effect of Obstructions
- III Simple or Non-Directional Antennas
  - A. Types
  - B. Use
  - IV Directional Antennas
    - A. Types
    - B. Use
    - C. Direction Finding
    - V Makeshift Antennas
      - A. Types
      - B. Use
  - VI Grounding

- A. Height of Antenna Above Ground
- B. Types of Grounding
- C. Grounding Within Building
- VII Concealment of Antennas
  - A. Temporary
  - B. Long-term
- VIII Antenna Impedance Matching
  - A. Methods
  - IX Construction of Antennas
    - A. Use of Kit Materials
    - B. Use of Makeshift Parts

The above is intended only as a general outline. Rearrangement, editing and revision will be made during Phase A and refined during Phase C.

within the manual several factors not shown in the general outline will be covered. The radiation efficiency of antennas of improper length will be illustrated. Antenna patterns showing major lobe angles will be included. Two or three basic transmitting situations will be discussed such as transmitting from a house, barn, apartment building, wooded areas, and open fields. In this discussion, information will also be given on the best type of antenna for location within an 8 x 8 x 8 room; i. e., whether it should be close to the wall or the middle of the room, etc.

SK / ET ( --

WASHINGTON, D. C.

25X1

#### GENERAL

In the preparation of the manual, the contractor will make use of available antenna information, particularly as regards choosing antennas to be discussed. Laboratory work will be limited to ascertaining impedance data on makeshift antennas radiation characteristics, and matching techniques.

The contents of the instructors part of the manual will be written at a level that may be absorbed by a person with a very limited technical background. Numerous illustrations will be included. In general, there will be a repetitive style used; that is, subjects will be introduced in very broad terms followed later by more detailed discussions.

The appendix represents the most challenging portion of the manual. It will show construction of antennas with possible illustrations of length versus frequency, height above ground and other parameters without the use of written material (i.e., length shown by man heights, etc.). The ways and means of preparing the appendix will require considerable study. However, we feel that a very good job can be done by our engineering group working with the illustration department.

## SPECIFICATION NO. 56-A-1055-A

T	ask	OUTL:	INE	
FOR				
	AN"	enna	MANUAL	

25X1

25X1

#### THE PROBLEM:

A simplified manual describing construction of antennas for radio stations is required for use by instructors possessing only a slight communications background. It should illustrate antennas suitable for erection by persons with no technical knowledge in what will generally be limited space, both indoors and outdoors. The antennas should be designed for maximum efficiency consistent with ease of construction and the requirement that they be compact and inconspicuous.

DISCUSSION:

- 1. The information contained in the manual should be based largely on current antenna knowledge applied to the particular requirements outlined below. It is anticipated that only a limited amount of experimental work will be performed by the contractor.
- radio operator the 2. As an aid to the training of a manual should cover:

25X1

- A. Simple directional antennas.
- B. Radiation efficiency of "short" (i.e., less than half wave) horizontal Marconi antennas.
- C. Graphical illustration of major lobe angles of antennas between 0.1 and 4.0 wavelengths long.
- D. Methods of improving radiation efficiency of a fixedlength antenna over a range of 3 to 30 megacycles.
- E. Antennas suitable for construction within a limited space, e.g. a 3-30 mc antenna in an 8'x8'x8' room.
- F. Relation between height of antenna above ground and optimum transmitting distance.
- G. Use of conventional and jumbled-wire counterpoise.
- H. Efficiency, directional characteristics and methods of feed of such makeshift antennas as window screens, tin roofs, metal fences, drain and water pipes, etc.

S-E-C-R-E-T

25X1

### SPECIAL CONSIDERATIONS:

- 1. The manual must contain no mathematics more complex than simple algebra. Graphs and illustrations should be used liberally. The handbook should be essentially practical, presenting detailed instructions for construction and orientation rather than discussions of propagation or antenna theory.
- 2. It should be remembered that the antennas under discussion are usually temporary and that ease of construction and adaptability to existing supports are major considerations.
- 3. An appendix will be included with detailed instruction sheets, one for each antenna, presenting in very simple terms and drawings all of the information necessary for a non-technical person to cut, erect and orient a particular antenna.
- 4. An original and two carbon copies of the proposed manual will be submitted for review and correction before preparation of the final draft.
- 5. The manual will be delivered on  $8"xl0\frac{1}{2}"$  white bond, with  $\frac{1}{2}"$  top, bottom and right-hand margins and a 1" left-hand margin. Since the pages furnished by the contractor will be photographed for direct reproduction they should be prepared on an electric typewriter, preferably one equipped with a one-time carbon ribbon. The text should be single spaced and an effort should be made to keep right-hand margins as straight as possible. Line illustrations and graphs may be furnished in any convenient size.
  - 6. Printing will be performed by the contracting agency.
