        Enclosed is a modified version of the drawing which you took away with
you after your visit here.   STATINTL

        The alarm system has been modified in accordance with your wishes to
operate in the following way.

1. Transmission Fault

    Should the computer fail to reply due to either repeated faulty transmission
    or failure of the Dataphone or lines, the alarm will sound for a period
    of about 6 seconds and the " Transmit Fault" lamp will light.   The
    lamp will remain lit until the fault is cleared by pressing the "Reset
    Logic" button.   The lamp may also be extinguished by pressing the
    "Fault Lamp Reset" button but this will leave the logic in its faulty
    condition.

2. Digitiser Input Fault

    Should one of the basic counters fail due to a faulty input, the alarm
    will sound for about 6 seconds and the "Digitiser Input Fault" lamp
    will light.   The lamp will remain lit until the counter in question is
    reset, and the "Fault Lamp Reset" button is pressed.   It should be
    remembered that there is also a fault lamp on the scales of the counter
    which will indicate which of the four counters caused the fault.

                                                                        STATINTL
                                            Yours sincerely,

Dear John,   STATINTL

      Just a very short note to say how pleasant it was to meet up with
you once again, and I hope that you found your stay with us [   ] STAT
useful from the point of view of discussing aspects of Dataphone.

      [   ] has certain things to put forward to you which are STATINTL
enclosed with this letter.

      Please pass on my personal regards to the mad Mexican and I hope
we can meet again in the not too distant future.

STATINTL
