

INTELLIGENCE MEMORANDUM

QUARTERLY ESTIMATE OF THE PRODUCTION OF AIRCRAFT IN THE SINO-SOVIET BLOC JANUARY-MARCH 1957

CIA/RR IM-450 30 April 1957

WARNING

THIS MATERIAL CONTAINS INFORMATION AFFECTING THE NATIONAL DEFENSE OF THE UNITED STATES WITHIN THE MEANING OF THE ESPIONAGE LAWS, TITLE 18, USC, SECS. 793 AND 794, THE TRANSMISSION OR REVELATION OF WHICH IN ANY MANNER TO AN UNAUTHORIZED PERSON IS PROHIBITED BY LAW.

CENTRAL INTELLIGENCE AGENCY

Office of Research and Reports

CIA INTERNAL USE ONLY NO DISSEMINATION ABROAD

S-E-C-R-E-T

FOREWORD

This memorandum is the eighth in a series to be issued on a quarterly basis summarizing production of aircraft in the Sino-Soviet Bloc. The estimates presented are issued to satisfy the requests of consumers for the most recent estimates of production of aircraft in the Bloc and are intended to supersede those contained in previous ORR publications. Changes in the present estimates from past estimates are the results of (1) the inclusion of new data on average days worked per week in Soviet aircraft plants and (2) more recent intelligence information. No interagency coordination has been attempted, and no dissemination of this memorandum outside CIA is planned.

S-E-C-R-E-T

QUARTERLY ESTIMATE OF THE PRODUCTION OF AIRCRAFT IN THE SINO-SOVIET BLOC JANUARY-MARCH 1957*

1. Trends in Production.

In the first quarter of 1957, estimated total production of aircraft, by number, in the Sino-Soviet Bloc increased about 4 percent above production in the previous quarter.** A corresponding increase also was noted in terms of airframe weight. These increases were mainly in production of fighters in the USSR, but Soviet transport aircraft also showed slight increases both in number of aircraft and in airframe weight.*** Approximately 54 percent of the aircraft produced by the Bloc during the first quarter of 1957 are believed to have been combat types.****

2. Production in the USSR.

The Soviet share of estimated total production of aircraft by the Sino-Soviet Bloc during the first quarter of 1957 remained about the same as in the previous quarter. f Of the 2,300 aircraft estimated to have been produced by the Bloc in the first quarter of 1957, about 1,800 aircraft, or approximately 80 percent, were produced in the USSR. Almost 92 percent of the estimated total production of aircraft, by airframe weight, in the Bloc took place in the USSR, thus indicating that the Satellites still are producing relatively lighter

---S-E-C-R-E-T

^{*} The estimates and conclusions contained in this memorandum represent the best judgment of ORR as of 1 April 1957.

^{**} Estimated production of aircraft in the Sino-Soviet Bloc from 1954 through the first quarter of 1957 is given by number in Table 1, p. 5, below, and by airframe weight in Table 2, p. 6, below.

^{***} Estimated cumulative production of selected Soviet aircraft through the first quarter of 1957 is given in Table 3, p. 7, below.

**** For the purposes of this memorandum, combat types include bomber, fighter, and ground attack aircraft. Other aircraft such as helicopters and transports have uses under both combat and noncombat conditions.

f Estimated production of aircraft in the USSR from 1954 through the first quarter of 1957 is given by number in Table 4, p. 8, below, and by airframe weight in Table 5, p. 9, below.

S-E-O-R-E-T

aircraft. About 88 percent of the estimated total production of combat aircraft in the Bloc during the first quarter of 1957 is believed to have taken place in the USSR.

It is estimated that total Soviet production of combat aircraft during the first quarter of 1957 exceeded that of the US by about 36 percent in terms of numbers and by about 15 percent in terms of airframe weight.* This estimate is accounted for by a decline of about 28 percent in US production of combat aircraft in the first quarter of 1957 and by an increase of about 6 percent in Soviet production of combat aircraft during the same period.

Recent intelligence information has caused several major changes to be made in previously published estimates of Soviet production of aircraft. Estimated production of the Bear, a heavy turboprop bomber, at Plant No. 18 in Kuybyshev has been lowered again as a result of recent sightings which revealed no Bears in the area of the factory. Analysis indicates a reduction in the estimated number of Badger (Tu-16) medium jet bombers produced at Plant No. 64 in Voronezh.

Although there has been no significant change in the estimated cumulative production of the Camel (Tu-104) jet transport, it should be noted that Plant No. 135 in Khar'kov has been established definitely now as the site for production of the Camel since early 1956 rather than Plant No. 22 in Kazan' as previously believed. As a result of Designer O.K. Antonov's visit to England in September 1956, Plant No. 473 in Kiev is believed to be producing 10 prototypes of the Ukraina, a new 4-engine turboprop transport. The first aircraft is believed to have been completed at the plant during the fourth quarter of 1956.

Conflicting information concerning production of a new jet fighter at Plant No. 168 in Rostov precludes a positive decision as to the present activity of this plant. Until clarifying information becomes available, Plant No. 168 is being carried as a possible producer of the Faceplate, a Mikoyan-designed jet fighter.

* Production of combat aircraft in the USSR from 1954 through the first quarter of 1957 is compared with that in the US by number in Figure 1, inside back cover, and by airframe weight in Figure 2, inside back cover. For additional comparison, US military acceptances from 1954 through the first quarter of 1957 are given by number in Table 6, p. 10, below, and by airframe weight in Table 7, p. 11, below.

have confirmed the pre-

25X1B4d

vious estimate of production of the Bison, a heavy jet bomber, at

25X1B4d

there has been no change in the external configuration of the Bison since the third quarter of 1956. On 17 March 1957, seven Bisons were sighted on the factory airfield. This total represents the largest number of Bisons observed on the field to date. Accumulation of these aircraft on the airfield could be the result of bad weather which prevented takeoffs or the result of a shortage of component parts.

3. Production in the European Satellites and in Communist China.

In the first quarter of 1957 the European Satellites produced an estimated total of about 370 aircraft, or approximately 16 percent of total production of aircraft in the Sino-Soviet Bloc. During this same period, Communist China is estimated to have produced 75 aircraft, all piston-engine trainers, accounting for about 3 percent of the estimated total production by the Bloc.* Czechoslovakia and Poland remain the largest producers among the Satellites, accounting for about 60 percent and 21 percent, respectively, or a combined total of about 81 percent of Satellite production of aircraft by number.

Recent sightings by the US Air Attaché to Czechoslovakia of Crate (IL-14) transports at the Prague/Letnany factory airfield for the Avia plant indicate that series production of the Crate is well under way. The current rate of production is estimated at four aircraft per month. The majority of new Crates sighted were painted with the blue trim of Aeroflot,** and three Crates carried Soviet registration numbers.

The Vodochody plant in Czechoslovakia is continuing production of the Midget (U-MIG-15) and the Fagot (MIG-15) aircraft to meet the requirements of the Sino-Soviet Bloc and to support foreign aid programs.

- 3 -

^{*} Estimated production of aircraft in the European Satellites and Communist China from 1954 through the first quarter of 1957 is given by number in Table 8, p. 12, below, and by airframe weight in Table 9, p. 13, below.

^{**} The carrier of the Main Administration of the Civil Air Fleet -- Glavnoye Upravleniye Grazhdanskogo Vozdushnogo Flota.

S-E-C-R-E-T

It is considered likely that, during 1957, evidence will become available indicating that production of the Fresco (MIG-17) and perhaps a transport or trainer type of aircraft has been initiated at the large Mielec plant in Poland. The Hare (Mi-1) light helicopter is in production at Lublin/Swidnik.

Reports of shortages of aircraft materials and construction delays at Dresden suggest that considerable slippage will occur in the planned program for production of the Crate in East Germany. Five Crates were assembled from Soviet parts in 1956. It is anticipated that aircraft will be produced on a prototype production basis until series production can be sustained, probably after mid-1957.

a. Figures are rounded to two significant digits. Totals are derived from unrounded figures and do not always agree with the sum of the rounded components.

b. This total was given incorrectly in the last memorandum of this series, CIA/RR IM-446, Quarterly Estimate of the Production of Aircraft in the Sino-Soviet Bloc, October-December 1956, 21 January 1957, SECRET/CIA INTERNAL USE ONLY. Instead of 840 units, the figure for total production of the Badger should have been 1,000 units.

c. This figure includes seven prototypes seen in July 1955.
