MEMORANDUM FOR: Chief, Scientific Analysis Division, OCS

SUBJECT : Supplementary Programming Request
for [REDACTED] Program

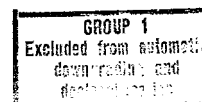

25X1A

Visual examination of original input data to Task I does not completely eliminate incorrect geographical coordinate data. Production runs on the [REDACTED] revealed additional incorrect coordinate input data. Since such data has already been converted from card to tape, they must be corrected or deleted from such input tape. It is requested that a short program be developed to perform the following:

25X1D

1. Generate program cards to sort original Task I input tape data in orbit (major) and chronological number (minor) sequence.
2. Corrected input data cards will be provided to OCS by SAS in orbit (major) and chronological number (minor) sequence.
3. The short program shall insert the corrected latitude and/or longitude data (2. above) into the original Task I input tape.
4. If the [REDACTED] is to be deleted from the input tape, corrected data cards will contain blanks for both latitude and longitude.
