The reactions of hexamethylcyclotetrasilazane and  
octamethylcyclotetrasilazane in the presence of alkali  
were studied, and it was shown that the reaction is  
accompanied by the evolution of methane and formation  
of "cyclolinear" polymers. Polymers with molecular  
chains containing the Si-N-Si bond, with m. p. up to  
500°, and good solubility in benzene were synthesized.
