DESCRIPTORS: *Refractory materials, Quartz,
Iron compounds, Nickel compounds, Chromium
compounds, Oxides, Combustion, Catalysis.

This work established that quartz packing accelerates
the combustion, especially at temperatures below
700° and that fire clay grog is more active than
quartz at temperatures higher than 700°, but at lower
temperatures the relationship is reversed. Oxides of
nickel and iron exert a higher promoting effect than
vanadium oxides and permit a lowering of the
