ZrCl<sub>4</sub> forms a dietherate with CH<sub>3</sub>OCH<sub>3</sub>; its infrared  
spectrum is discussed. During its pyrolysis, two  
processes are superimposed: 1) dissociation with for-  
mation of the monoetherate; the corresponding heat of  
dissociation is determined from the vapor pressure  
curve as 10.5 kcal/mole; 2) decomposition to the  
monomer or condensed chlorine-containing methyl  
zirconate, which occurs with formation of methyl  
chloride. The chemism of these reactions can be  
studied via the infrared spectrum. (Author)

The directed interesterification of palm oil is investigated in accordance with the principles developed by E. W. Eckey. Through the different analytical methods it was possible to ascertain the influence of the reaction time, the temperature, mechanical stirring as well as the quantity and the degree of distribution of the catalyst on the changes of glyceride composition of palm oil.
