1956, v. 26, no. 12, p. 2661-2666.

A dynamic method that makes possible the compression of a substance up to pressures of hundreds of atmospheres. Tentative experiments performed by this method have shown that in the case of rapid compression and expansion there take place in certain substances appreciable irreversible changes. It was not possible to make diamond from graphite by this method because of the low rate of transition.

Trans. of Zhurnal Fizicheskoy Khimii (USSR) 1946,
v. 20 [no. 11] p. 1363-1366.

The rate of decomposition was found to decrease
under pressure. At 45,000 kg/cm² pressure, in
order to provide a decomposition rate equal to that at
atmospheric pressure, the temperature of the azide
must be raised by 67°. The decomposition rate at
45,000 kg/cm² and 235°C is lower by a factor of 58
than the rate at atmospheric pressure and the same
temperature. The dependence of the temperature re-
quired for equal decomposition rates on the pressure
was established. (Author)
