A RADIOTRACER STUDY OF AQUEOUS POLYMERIZATION OF ACRYLONITRILE USING POTASSIUM PERSULFATE INITIATOR. [1960] 10p. 10 refs.
Order from SLA mi\$1.80, ph\$1.80 61-10594

Trans. of Kobunshi Kagaku (Japan) 1960, v. 17, no. 182, p. 364-366.

An aqueous polymerization of acrylonitrile at 60°C was studied radiochemically using S³⁵-labeled potassium persulfate initiator. The number average molecular weight of polyacrylonitrile was estimated from the limiting viscosity number of N,N-dimethylformamide solution at 25°C. The number of initiator fragments per polymer molecule was determined to be about one. It was also shown that the chain termination occurs dominantly by bimolecular reaction. These results indicate that the disproportionation is the dominant chain-terminating process. (English abstract appended to original)
