It is shown that the Bauschinger effect depends on the emergence during monoaxial plastic deformation of residual oriented microstrains. The reduction of the conventional yield point during reloading of the reverse print is correlated satisfactorily with the magnitude of residual oriented microstrains arising after preliminary deformation, most favorably in the region of 0.5 to 1.5%, and the magnitude of residual oriented microstrains can be summed up with macroscopic strains created by the external load. Thermodynamics.

The study deals with the determination of vapor pres-  
sure within the temperature range of 1651-1764°K by  
Knudsen's effusion method. The boron vapor pressure  
depends largely on the S/K ratio. Saturation is  
reached in the chamber only when the S/K<sub>0</sub> ratio is  
larger than 15,000-20,000.

On the basis of thermodynamic calculations, equilibrium constants and free energies were obtained for the pyrite oxidation reaction in relation to changes in temperature. DESCRIPTORS: \*Thermodynamics, \*Coke, Coal, Heat of formation, Entropy, Calorimeters, Pyrolysis.

This study determined the heats of formation of the solid products in the thermal decomposition of G<sub>2</sub> gas coal and its vitrain. Entropy determinations were made from measurements of the heat capacity at low temperatures. (Author)
