It has been shown that graft copolymers of the diphilic
type may be produced by heating mixtures of metha-
crylic and α -hydroxypelargonic acids or of metha-
crylic acid and the polyhydroxypelargonate in the
presence of p-toluenesulfonic acid. The properties of
the resultant graft copolymers have been investigated.
It has been shown that spherulites are formed in the
graft copolymers. (Author) (See also 60-18470,

The state diagrams were studied of a series of grafted copolymers of diphilic type (starch-polystyrene, polyethylene terephthalate-polyacrylic acid) and grafted copolymers containing starting component having common solvents (polyisobutylene-polystyrene, polystyrene-polyvinyl acetate). In all cases the grafting causes lessening of the true solubility of the grafted copolymer as compared with the starting homopolymers. For the grafted copolymer from polystyrene and polyvinyl acetate the dissolution process is described by means of thermodynamical functions on the basis of data on integral mixing heat with benzene and hydrogenated monomers.
