

## THE INTELLOFAX SYSTEM

### Introduction

The history of the Intellofax System encompasses many facets of the information and storage retrieval system of the Office of Collection and Dissemination (OCD) and its successor, the Office of Central Reference (OCR). Two Divisions, the Machine Division (MD) (Central Index of the Reference Branch, Office of Reports and Estimates [ORE], until May 1948 and then Machine Methods Division [MMD] of OCD until September 1951) and the CIA Library (Intelligence Documents Division, ORE Reference Branch, until May 1948) were responsible for the development and operation of the Electrical Accounting Machine (EAM)-supported document storage, reference, and retrieval system. The office reorganization of November 1956 added a third layer of responsibility—a new Document Division (DD). \*

This history covers all aspects of the Intellofax System from 1947 until its demise in 1967: equipment developments and improvements, including microfilming, print service, and fast transmission of data; classification input scheme; and retrieval. A project that had great impact on the Intellofax System but was not adopted—Minicard—is also discussed in detail.

The Intelligence Publications Index (IPT), the printed index of finished intelligence documents, is historically part of OCD/OCR's information storage and retrieval system and therefore appears in this chapter with the Intellofax System.

The effect of the Intellofax System of the Library Consultants' Survey of 1957 and the resulting Task Team Reports of 1958 is discussed in Chapter \_\_\_\_ (the CIA Library) of the office history because of the overall impact on the Library.

1. Early Developmental History

a. Objectives

In providing a central reference service to the Central Intelligence Group (CIG) and its successor, the Central Intelligence Agency (CIA), as well as to the intelligence community, the early managers of the Agency recognized the need to develop a machine capability for indexing and retrieving a staggering quantity of intelligence documents. The resulting Intellofax System was unique--no other government agency, no university or library, and no commercial firm had anything of its type in operation. The name was coined in 1949 by Dr.  the first Assistant Director (AD) of OCD, to describe the system that combined IBM and facsimile reproduction techniques for intelligence documentation purposes. Later, Intellofax became a household word not only as an adjective (the Intellofax System and the Intellofax files) but also as a verb form (intellofaxed and intellofaxing for the indexing aspects).

The actual authority for establishing the Intellofax System appeared in July 1947 in ORE Instruction 31-47, entitled "Functions of the Reference Center." <sup>1/</sup> Thomas Babbitt, AD/RE, charged the Central Index and the Intelligence Documents Division to:

- (1) index, by business machine procedures, the subject matter of all available reports, and other documents of a foreign intelligence nature
- (2) classify and catalogue all intelligence documents of a foreign intelligence nature available to CIG.

4

b. Early Equipment Needs

25X1A9A [redacted] Chief of Central Index, was given the responsibility for organizing and developing the initial essential steps toward establishing a central indexing and filing system, in conformity with an earlier Interdepartmental Coordinating and Planning Staff (ICAPS) recommendation in March 1947<sup>2/</sup>. It soon became apparent that no existing equipment would be capable of meeting the needs envisaged. Although an IBM punch card offered great flexibility and speed in the handling of thousands of cards, each of which would represent a particular document, no card would carry enough printed data to supply the researcher with titles and descriptions of documents.

During 1947 [redacted] 25X1A9A [redacted]

met with top management of Finch Communications, Inc., to discuss the possibilities of the use of standard Finch Telefax machines and the adaptation of these machines to the documentation problem. A Vice President of Finch said that his company would be willing to cooperate with IBM in adapting the Telefax machine to automatically reproduce bibliographic and subject abstract data typed on IBM cards onto any type of paper that included a duplicating medium. This would answer the problem of preparing <sup>document</sup> accession lists and lists of abstracts requested. \*

*ibid labar*  
 3/ (Source: ORE [redacted] 1147 - 1, [redacted] 3/)  
 \*Management originally planned for a daily accession list of these documents received and indexed, all of which would be abstracted. This plan was given up in 1949 as entirely impractical and uneconomic.

5/Memo, Chief, Index Division to C, Machine Methods Branch, 14 Jan 49, sub: Report on Inspection of Progress of Special Equipment being Manufactured by Finch, Inc. Co. (in Machine Division 1947-54 ~~60-54871~~) 58-98/3

6/Memo, [redacted] Chief, Management Staff, 18 Oct 49, sub: Contract with Finch Telecommunications, Inc. (in Machine Division 1947-54 ~~60-54871~~) 58-98/3

25X1A9A

After numerous meetings with Finch and investigation of other companies, such as RCA and Eastman Kodak, the machine experts opted for Finch, and a contract was let in January 1948. By July Finch had produced the first of the Library Recorders and had completed the final design for the IBM card scanner. Both awaited OCD approval. Experimenting and testing continued, and in January 1949 [redacted] reported favorably on the equipment.

Progress reports were prepared periodically throughout the first 6 months of 1949; test runs were made during June, and the equipment was finally accepted in July. The Projects Review Committee (PRC) on 27 July 1949 approved an amendment to the original contract, which had been for \$100,000, to increase the amount to \$203,000.

The Intellofax Card, or Faxcard, (see Figure 1) was an IBM punch card of standard shape and dimensions, which bore on its face up to 200 words of printed information-- the so-called bibliographic data: source, country, date, title, possible abstract, pagination, and security classification. The corresponding coded, punched, and interpreted data appeared at one end of the card. The cards were sorted, selected, and arranged by standard IBM machines, and the printed information on the selected cards was transmitted and reproduced by facsimile process.

The equipment delivered in May 1950 was the second prototype resulting from the developmental engineering begun in May 1948. "Shakedown" tests were still being conducted in mid-1951 concurrent with actual usage. [redacted], an Office of Communications

employee (and formerly an engineer with Finch), was on temporary duty with OCD and placed in charge of the Faxcard equipment. He wrote to 25X1A9A m.d. (Chief of ~~the Machine Methods Division~~ since September 1950) that since the equipment was not standard, additional development was anticipated before the equipment's stability could be placed in a class with that afforded by existing teletype machines. <sup>7/</sup>

The Intellofax tape, as it was known throughout the entire Intellofax history, was originally a 4-inch-wide tape prepared by the facsimile process. The Intellofax punch card was fed into a transmitter, which optically scanned the printed information. A receiver received signals from the transmitter; the printed information was impregnated into a chemically treated tape, which was dried by a heat process.

The early OCD managers had hoped to electronically transmit the Intellofax information to requesters in their own office locations. <sup>8/</sup> As of 15 May 1950, six transmitters and 12 receivers had been delivered (see Figure 2). Experimentation continued throughout the summer months, and the first <sup>was</sup> transmission strictly local--transmitter and receiver side by side in the <sup>m.m.d.</sup> Machine Methods Division. One receiver was placed in K Building in the Branch Library, but security considerations and technical problems of transmission were responsible for not continuing with what seemed like a Utopian transmission phase. The completed folded tapes

were delivered to the requester not via electronic transmission but by hand.

c. Coding Schemes

(1) The Intelligence Subject Code

In conformity with the wishes of ICAPS, the Central Index also took steps to prepare a unified subject classification scheme. [redacted] 25X1A9A, Acting Chief of the Reference Center, wrote to [redacted] 25X1A9A 9/ in July 1947:

Although the Reference Branch has taken the initial steps in the direction of establishing central indexing and filing procedures, any unified acceptance of the end product of these investigations will depend upon joint action of IAB [Intelligence Advisory Board] and CIG representatives and the agencies' final acceptance of the system decided upon.

On 14 July 1947 [redacted] 25X1A9A entered on duty as Chief of the Classification Unit of the Intelligence Documents Division to work with the Central Index in developing a classification schedule for CIG. 10/

It was soon evident that the War Department's Basic Intelligence Directive (BID) devised during World War II for collection purposes (although it had been used for classification of documents in the G-2 Library in Vienna immediately after the war) was not adequate. The subjects listed in the BID were not sufficiently comprehensive to cover the wide range of subjects in intelligence documents because it had been devised for Army purposes only. The economic, political, and scientific sections were woefully weak. It was decided to prepare a list of subjects that would include those contained in the BID,

9/ Addicott memo (2, above)  
10/ Reference Center Library Monthly Status Report 26 June-28 July 47. S. File: Library 1947-48 Job: 58-98/1

the Navy Monograph Guide, the abridged Dewey Decimal system used by the State Department, and for scientific subjects, the Voge Classification, prepared and used by the Joint Research and Development Board (JRBD). [REDACTED] <sup>25X1A9A</sup> the Librarian, and [REDACTED] <sup>25X1A9A</sup> made visits to the parent organizations using these classification schemes.

By August 1947 [REDACTED] Classification Unit of three people, with the assistance of [REDACTED] <sup>25X1A9A</sup> a classification specialist from JRBD, had completed a general framework of an all-inclusive classification schedule. The major subject categories included Army, Navy, Air, Political, Economic, Sociological, Scientific, Geographic, and Biographic. On 22 August a familiarization meeting was held with duly appointed representatives of the three services. The participating IAB agencies agreed to develop and/or revise their respective military categories in the BID. To those categories would be added the CIG contribution, consisting of the nonmilitary subjects. Because the War Department was not inclined to change the numbering system of the BID (eight digits), it was to be used as the nucleus of the new classification system. <sup>11/</sup>

STAT

\* OCD tried unsuccessfully to recruit Mr. Ball as a permanent employee.

25X1A9A

[redacted] was not very enthusiastic about the cooperation from the other agencies. He and [redacted] had visited the State Department Librarian, who welcomed a comprehensive expansion of the Army, Navy, and Air subject classification, but <sup>stated</sup> felt that this expansion should be incorporated into the abridged Dewey. The representatives of the IAB agencies seemed to feel that what CIG was trying to do with a new classification would replace the classification <sup>that</sup> ~~which~~ each agency was using. This was, of course, the ultimate aim, but it would not be realized even partially until the Air Force adopted the Intelligence Subject Code <sup>(ISC)</sup> in 1954. Each representative took a cosmic view of the fields <sup>that</sup> ~~which~~ were of primary interest to his agency and argued that the whole structure of intelligence would be imperilled <sup>by</sup> ~~by~~ any deviations with its own scheme.

So <sup>CIA</sup> ~~the Library~~ set about continuing with its own classification. <sup>ISC</sup>

The first edition of the Intelligence Subject Code <sup>(ISC)</sup> ~~(henceforth referred to as the ISC)~~ was dated 15 March 1948. The Preface indicated that the edition was provisional and that the subject headings were intentionally kept rather general so that expansions and revisions could be made as experience required. There was no index to this first edition. A biographic or "Who's Who" class <sup>that</sup> ~~which~~ was in the original outline was deliberately omitted because <sup>of this</sup> ~~of~~ the Biographic Intelligence Register was already indexing biographic information.

The main classes and the number of notations (codes) were:

- 000 International Situation (32)
- 100 National Affairs (120)

10

- 200 Army (139)
- 300 Navy (181)
- 400 Air Force (83)
- 500 Weapons and Scientific Warfare (44)
- 600 Science and Technology (82)
- 700 Geography and Economics (232)
- 800 Social and Cultural Forces (67)

Total notations: 980

Each of the eight categories was broken down to provide, as nearly as possible, for the needs of the agency chiefly concerned-- the Army, Navy and Air Sections following closely the patterns developed by the three services for their own use. The other sections had been worked over in detail with the ORE units chiefly concerned.

Chapters 100 through 800 retained their overall subject outline until the complete revision of the ISC in November 1960. Further chapter subdivisions appeared throughout 1948, but it was not until November 1948 that the 600 and 700 sections were expanded to the full six-digit capacity allotted on the IBM card). A relative index (alphabetical) was printed at the same time.

25X1A9A

\* [redacted] who had reported for duty in the Library on 9 February 1948, took over from [redacted] 25X1A9A in mid-1948 as Chief of the Analysis Section (formerly the Classification Unit). (She remained head of the input or classification effort for the Intello-

downgrading and  
declassification

\* [redacted] had been in charge of the G-2 Library in [redacted] for 2 years 25X1A6A

for almost 20 years until the demise of the system at the end of 1967.) During the first 5 years she worked closely with analysts of ORE (became the Office of Research and Reports [ORR] in November 1950) and the Office of Scientific Intelligence (OSI) in the continuous revision process, to ensure more effective organization of the information in documents. These research analysts pointed out deficiencies in certain subject fields and suggested appropriate changes. Most suggestions benefited and improved the ISC; others reflected only parochial needs of insistent and narrow-in-outlook requesters who raised their subject specialty out of all proportion to the entire scheme of knowledge. The latter type of requester made one section of the ISC look ridiculous, which was later used as an example of what not to do when constructing a classification scheme: the subject code for Plant Pathology (632.4) was subdivided into 68 different codes for wheat, rye, barley, oats, and miscellaneous crop diseases, with the name in English followed by the scientific term in Latin.

The 1949 ISC resembled the original 1948 edition only in the eight major chapter headings. Within each chapter much restructuring took place. A new heading for Communism was added, and this 114 section became the most widely used and remembered throughout the book. Geography was moved from the 700 to the 600 chapter. In 1950,

\*

after the Library decided to catalog books according to the ISC, a 900 chapter (Organization of Information) was added.

The history of the ISC was a history of change and <sup>now</sup> and were reduced to hoped-for improvement. 980 codes grew to 15,000 <sup>by</sup> 1959

5,000 in 1960. A review → of the master copies of the ISC during these 20 years

reveals many pages of revisions. New ~~Editions~~ <sup>editions</sup> were published in 1954, 1957, 1960, 1962, 1964, and ~~March~~ 1967.

Changes in subject codes necessitated the preparation of new cards. The printed information was transferred from the old card to the new card by means of a heat process, whereas the punched data were converted by machine ~~underpunches~~ to the new codes. This was a time-consuming process and caused machine backlogs.

*what on earth is a cylinder punch and how it works?*

All classification schemes have limitations, and the ISC was no exception, particularly since code expansion was tied into the allotted spaces on the IBM card.

By 1950 it had become evident that certain aspects of information could be uniformly applied to almost all commodity and equipment subject codes in the 700 chapter.

The Library and MD personnel developed a list of one-to-two-digit "action" or prefix modifier codes for such refinements

of the subject codes → as production data, imports-exports, repair, <sup>and</sup> procurement.

\* See <sup>#</sup> ~~chapter on the~~ (Library).

\*\* For discussion of the complete revision of the ISC in 1960, see page \_\_\_\_.

\*  
~~and any others.~~ The classifier entered them on the code sheet by placing a slash between the modifier and the subject code. For example, the production of coal was written as 4/735.1. The slash appeared on the IBM card as an extra punch (called an "overpunch") above columns 1-6 (subject field).

*moreover, what  
an overpunch?*

This important change in the coding process eventually extended to other chapters of the ISC. Prefix modifiers were applied to the military chapters in 1954 for such aspects as security, vulnerability, sabotage, order of battle, specifications, and descriptions of military equipment. Other devices to show coding specifications were inaugurated as the need arose. \*\*

(2) Area Classification <sup>14/</sup>

(a) AMS In their 1947 plans for the development of a classification scheme, [ ] chose the Army Map Service (AMS) Library Area Classification as the best and most adaptable system for coding geographic areas. According to this system, the world was divided into 26 main divisions, A through Z. Each ~~alphabetic~~ division was ~~further~~ subdivided, moving from right to left with a numeric designation. For example:

- M Europe,
- 11M Scandinavia
- 11M Denmark
- 21M Finland
- 31M Norway
- 41M Sweden
- 111M Northern Sweden
- 211M Southern Sweden

\* The professional personnel who provided input to the Intellox System were called by various titles: classifiers, indexers, coders (the most common, but the least professional), and finally Library or document analysts. In this discussion, they will be referred to as classifiers.

\*\* See early editions of the ISC. *in Intellox Manual 7th*

AMS did not maintain its area classification on an up-to-date basis; therefore, the Analysis Branch was constantly expanding the code and updating it to specific Intellofax needs, as in the case of developing and emerging nations.

(b) Related Areas

Two years of experience pointed up the inability of being able to show any area relationships. This came to a head with the 1950 Korean War, when it became necessary to be able to show some combination of Communist China, USSR, North Korea, South Korea, or the United States. The entire punching area of the IBM card (other than the subject field, which always remained the first six fields) was revamped, eliminating certain codes that did not seem necessary, such as day of information, and adding two two-digit abbreviated area codes to be used as related or secondary areas in columns 15-22.

(c) Area File

The advent of the Korean War also brought out the need for a separate file arranged by area. Requests coming in for everything on Korea could not be answered quickly because the primary file arrangement of the Intellofax cards was by subject code. Beginning in September 1950, MD started an adjunct Area File by preparing one extra card for each main area. (There was no card filed by related area.) No subject code was punched into this card. The Area File continued to serve effectively in retrieving all information on smaller

areas, such as oblasts of the USSR and the provinces of China. Because the Area File grew so rapidly and was consequently useless for large areas in its set-up without subject code punches, the Library's Analysis and Reference Branches in <sup>\* (February)</sup> 1954 made an agreement, concurred in by MD, that area cards would not be prepared for Western European countries, <sup>16/</sup> USSR, Mexico, Australia, and New Zealand.

In 1955 another important change was made in the Area File. The classifier underlined one subject/area combination considered most representative of the whole document. The entire six-digit subject code was punched into the area card, but within a given area the card was filed only by the first three digits of the ISC.

*The Area File was finally destroyed in 1968 because by that time little use was made of it.*

\* From the very inception of the Intellofax System, retrieval responsibility was placed with the reference librarians because Intellofax queries were considered no different from other reference questions. See chapter on (Document Division) for transfer of responsibility in November 1965.  
16/Area Underlining, 23 Feb 1954. C. (in op.cit. 15, above)

(3) Miscellaneous Codes

(a) Security Classification

With the completion of the ISC (although there would <sup>be</sup> continual revision) and the adoption of the AMD Area Classification, thought was also given to other necessary codes to be punched into the IBM card for complete retrieval. [redacted] issued a memorandum on STAT 3 January 1949 establishing <sup>security</sup> uniform codes to be used in all OCD coding operations. The Intellocfax System Procedure Manuals <sup>17/</sup> show the security classifications with various controls that evolved as more and more non-CIA requesters used the System. These codes enabled if necessary, MD to eliminate certain document citations with controls such as Controlled Dissemination, Warning Notice-Sensitive Sources, No Dissemination Abroad, and No Foreign Dissemination.

(b) Source Locator <sup>18/</sup> (For <sup>Discussion of</sup> Source Card File, see page <sup>42</sup>)

In June 1948 the Library issued Library Bulletin No. 18, entitled "The Locator System"; it explained that the intelligence document files in the Library had been set up according to codes <sup>assigned to</sup> ~~for~~ source <sup>of origin, such as Army</sup> designations. Arbitrary ~~type~~ designations were established to differentiate between reports <sup>reports</sup> ~~attaché-type~~ (so-called "A" type) and finished intelligence reports (so-called "S" type). These source codes were also used on the Intellocfax punch card. For example, 05A7552 referred to an Army Attaché report from [redacted] (see Figure 1)

<sup>17/</sup> Procedure Manuals (op. cit. 15, above)

25X1A6A

By 1 June 1949 it was necessary to issue a second bulletin because of numerous changes in organizational divisions of government agencies. By February 1950 the arbitrary "A" and "S" type designations were no longer punched into the Intellofax card.

The six-digit source locators remained basically unchanged until May 1954, when specific city or post locators for Army, Navy, and Air ~~attache~~ reports were no longer considered necessary for retrieval. By January 1956 only the two-digit source locator was used for everything except CIA, [redacted] and Top Secret documents.

25X1X7

The coding schemes described in the previous pages provided selectivity in retrieval. Requesters were always urged to be as specific as possible on subject requests and not to ask for too general a subject, such as Politics (the entire 100 chapter of the ISC [redacted]). The only reason for a six-digit ISC was to pinpoint specific subjects, if possible. Provincial breakdowns of the USSR and China helped area specialists. Requesters were also reminded that the date of publication was punched in the IBM card. Why ask for all years when only 1950 was needed? Security classification and source specificity were part of the retrieval picture, although not requested as often as subject, area, and date limitations.

STAT

The following is a typical request using all the code parameters:

Communist Party penetration of labor organizations in [redacted] during 1949-50. CIA document (SO) only. Through Confidential

\* Source locators: 01-Air; 02-CIA; 03-Navy; 04-State; 05-Army; 06-Defense in general; 07-14 Other government agencies; 15-Executive, Legislative and Judicial Branches; 16-Non-government; 17-International Organizations; 18-Foreign Governments

02-0404	Source	(columns 13-20)
3	Security classification	(column 12)

(4) Abbreviation File

A reference tool <sup>that</sup> ~~which~~ the classifiers found a need for as early as January 1949 was a ~~list~~ <sup>list</sup> of abbreviations of organizations ~~which~~ <sup>that</sup> appeared in intelligence documents. The Agency Management Officer approved the establishment of a Central Abbreviation File in the Library. <sup>19/</sup> It was originally planned that periodically printed cumulative lists of abbreviations would be published for general circulation and that the entire Agency would contribute to the growth of the file.

The ~~growing~~ Abbreviation File of 3" x 5" cards was used not only as an indexing aid, but also by reference librarians when published lists of abbreviations did not answer specific reference queries. The card contained the abbreviation, the area, the title translated into English, the foreign title, a brief descriptive comment, and the source of the abbreviation. Offices throughout CIA, particularly the Foreign Documents Division (FDD), supplied hundred of abbreviations and their identification to the file. A note appeared in the front of the CIA Telephone Directory under services of the CIA Library encouraging requesters ~~to~~ <sup>to</sup> make use of the file. In 1954 a publication was distributed entitled Part I. Abbreviations of USA, [redacted], and

25X1X7

(1) [redacted] Daily Reports

From the very beginning, the Reference Center was eager to begin some kind of indexing, so while negotiations were continuing for the development of the Intelifax equipment and for the construction of a unified classification scheme, management authorized the indexing of the [redacted] Daily Reports. This was in 1947 accordance with a memorandum to the Agency's Assistant Executive from the Assistant Director of Operations. The monthly Table of Contents to the Daily Reports was considered inadequate for retrieval purposes and was therefore discontinued with the 1947 May issue.

The Daily Reports became the first data base available for machine retrieval from the Reference Center. The Central Index began IBM card punching on 19 August 1947 for that material which the Classification Unit (of the Intelligence Documents Division) had been indexing. The index cards contained the following information: security classification, pamphlet data, one one-digit subject from nine major subject categories (Army, Navy, Air, Science and Geography, Domestic Political Affairs, Foreign Political Affairs, Economics, Sociology, and Miscellaneous), page reference, intercept headline, transmitter, target countries.

Ninety-nine countries with a two-digit sequential code made up the area codes. The requester was furnished with a listing of the selected cards showing intercept heading, page reference, pamphlet data, security classification, and areas. By the end of September 1947, 14,762 cards had been punched and filed. By November the index covered reports issued since May and an announcement was sent out to all recipients of the Daily Reports.

25X1A7B

This method of indexing  Daily Reports continued until January 1949, when a procedure was put into effect ~~which~~ <sup>which</sup> allowed for a redesign of this particular IBM card in order to make use of the ISC subject and area codes. Again, only one subject code was permitted. The name of a prominent individual <sup>numbered in the Report</sup> was entered in the first 15 spaces of the caption, which was restricted to 40 spaces.

25X1A7B

A year later  and the CIA Library jointly prepared for inclusion in the front cover of all restricted issues a short announcement advertising the available indexing facilities. Based on recurring requirements from certain offices, particularly ORE/ORR and OSI, <sup>the Library sent out</sup> typed lists of pertinent titles to these offices every week.

By early January 1952 the Library advised the discontinuance of the indexing of the Daily Reports for <sup>various</sup> ~~several~~ reasons: requests averaged only 10 a month plus four recurring requests; and with indexing restricted to one subject per article because of workload in the Analysis Branch and in the <sup>and</sup> Machine Division, adequate cross references to cover all subjects within an article could not be made. The Chief, Analysis Branch, ~~in a memo to the CIA Librarian~~ stated that the two analysts thus released would be able to devote full time to help reduce the Intellofax backlog of several thousand documents. <sup>257</sup> Dr. Andrews concurred because

of severe 1952 manpower cuts and because the OCD Registers picked up the personality and industrial plant information found in the Daily Reports. On 6 February the Library discontinued the coding of all radio broadcast information. Although the IBM cards were retired to the Records Center, the Library retained a master printed form of all the coding effort.

The issue of the desirability of reestablishing a machine index to the FBIS Daily Reports was raised periodically. \*

(2) Early Intellofax Coverage

With the publication of the ISC in March 1948 it was possible to start indexing in earnest. The first efforts were confined to OO-B reports issued by the Office of Operations (OO) Contact Office. ~~Interim Contact Register (ICR)~~ 26/ One Transmittal Sheet was prepared for each document: It contained a bibliographic statement (source, document number, country, date of publication, date of information, title, and security classification), an abstract of the contents, and pertinent codes. Until the Central Index had typing personnel and reproducing equipment to type and reproduce abstracts on the tabulating cards, only the punched data appeared on the IBM cards; the Transmittal Sheets were filed in the Library by source. 23

Plans called for the receipt of 1,000 documents a day.

25X1A9A

Experience already showed that a classifier could abstract only 30 documents a day. [ ] noted <sup>27/</sup> that a T/O of 20 professionals in the Analysis Section would not provide adequate manpower to abstract every document. In November 1948 the current intake was between 400 and 500 items a day. The 1948 backlog of approximately 12,000 SO (predecessor of CS documents from the Clandestine Services) and 3,000 other CIA reports was decreasing by 150 items per day. Of the backlog of non-CIA reports it was estimated that five percent of the 154,000 items would not warrant indexing because of content. The unclassified and restricted documents for 1948 were indexed by Special Projects # 1 ("the pool"). Documents issued in 1946 and 1947 were processed but only those of priority areas of interest. [ ] stated that it appeared possible that "we can set a 1 January 1949 target for providing daily tab-fax service." And this did occur.

<sup>27/</sup>Memo, Chief, Library to AD/CD, 10 Nov 48, sub: Classification and Indexing of CIA Library Documents, Status of. C.

24 Approved For Release 2004/09/23 : CIA-RDP84-00951R000300040002-5

Heavy backlogs frequently required stringent measures that affected coverage. For 4 months in 1949 unclassified State Department despatches were not indexed. This was briefly expanded to include any document from Greece, Turkey, or African and Latin American posts. No effort was made later to fill this void.

Document coverage rose from 46,681 documents in 1948 to 227,106 in 1950, or a total of 414,329 documents indexed into the Intellofax System <sup>using</sup> the first 3 years. <sup>28/</sup> There are no comparable figures available on the number of Intellofax requests received in this same period. From 1951 through 1953 requests <sup>per cent</sup> averaged 311 monthly, <sup>29/</sup> 20% ~~of which were~~ from outside CIA. <sup>in 1951</sup> A chart prepared for the Clark Committee showed the annual input and output of the Intellofax System (Figure 3 )

By 1953 increased emphasis was given to indexing all available material on China by three projects in conjunction with the Foreign Document Division (FDD): (a) the Chinese Periodical Index; (b) Chinese Annotated Bibliography; and (c) the Chinese Economic Statistical Charts (CESC). The CESC project of 3,957 items was completed by a classifiers of Chinese extraction in the Analysis Branch by March 1954.

(3) ~~NODEX~~ *Nodex*

Early in the indexing processing it became apparent that certain documents dealt with information ~~that was~~ <sup>that</sup> of little or no intelligence value for retrieval purposes.

The term <sup>"Nodex"</sup> ~~"NODEX"~~ was coined to represent those documents ~~which~~ <sup>that</sup> would not be indexed into the Intellofax System.

Originally these were documents of a purely administrative nature. As the System grew, however, more subjective judgment as to the value of certain information for Intellofax retrieval purposes was exercised, and the list of NODEX items grew and changed. In some cases, it was subject information ~~which~~ <sup>that</sup> was rejected; in other cases, it was an entire series.

~~There was no way the Library could prevent the receipt of these documents; besides, some office in the Agency might want to see them.~~ The whole question of what should be nodexed was ~~very~~ much debated throughout the entire Intellofax history.

No two researchers agreed, and much criticism was levied on the System because of certain ~~NODEX~~ <sup>NODEX</sup> decisions. <sup>which had not been considered by major circles within CIA with the community.</sup>

The selection out criteria in the early days of the ~~entirely~~ Intellofax System fell upon the classifier, who would so mark a document and its attached control card in the batch envelope.

*from review*

The Incoming and Dispatch Unit of the Library soon recognized certain series, such as Army Who's Who Reports. These were batched separately and did not even come to the ~~attention~~ <sup>classifier</sup>.

*Plan D-D 1962-63 folder 65-413/4*

*Handwritten notes and signatures at the bottom of the page.*

26

The early 1950 ~~NODEX~~ Standards included such topics or series as: <sup>30/</sup>

- a. Purely administrative matters
- b. Consular or commercial functions (replies to complaints of Americans about lack of service)
- c. Notification of change in security classification
- d. Agendas of various international committees
- e. Order of battle (considered a military responsibility)
- f. Transmittals of enclosures not attached and not described adequately enough for indexing
- g. Industrial Card File (CF) reports giving primarily plant data (and, therefore, an Industrial Register responsibility)
- h. Who's Who reports
- i. Joint Weekas (considered cables)

Out of 17,367 documents processed in January 1951, 1,125 or six percent of the total were nodexed.

A printed list entitled "~~NODEX~~ Standards from Start of the Intellofax System to July 1966" is indicative of the colorful history of the ~~NODEX~~ program. <sup>31/</sup> Translations and FDD products

were particular targets for changing criteria as the following dates show from the Intellofax Chronology: <sup>32/</sup>

*how do you decide when use NodeX or when NODEX?*

- August 1954 Nodex FDD Summaries and Reference Aids
- October 1960 Nodex unclassified translations
- July 1963 Nodex all translations
- Sept 1963 Exception made on translations from or about Communist China
- Feb 1964 Nodex all translations from newspaper, magazines, and books
- Index all others
- March 1965 Index FDD Summaries

The microfilming of ~~NODEXES~~ is discussed along with the microfilm criteria on page \_\_\_\_.

An indexing economy <sup>that</sup> which developed was the so-called "Flash" procedure. <sup>33/</sup> By January 1949 classifiers recognized that there was a sizeable segment of documents ~~which~~ <sup>that</sup> covered the same subject matter each time and which were issued periodically. "Quarterly Military Review," "Weekly List of Infectious Diseases," "Semi-Annual Railroad Statistics" were a few examples. It was a waste of indexing and key punching effort to code these documents every time they appeared. The <sup>first time</sup> ~~initial time~~ such a document was encountered ~~it~~ was coded and abstracted in a table of contents manner; the Intellofax card bore the usual bibliographic statement but without report number or date. The word "Flash" appeared on the IBM card. A master Transmittal Sheet on which the abstract was prepared was filed in the <sup>so-called</sup> "Flash" <sup>book</sup> in the Analysis Branch. Every time a similar document was received, its report number and date were entered into the "Flash" book, ~~on the Transmittal Sheet~~. When a subject retrieval request turned up the original "Flash" card, <sup>it</sup> the librarian or classifier knew that he must refer to the "Flash" book to find all the documents <sup>that</sup> ~~which~~ had been published and received. <sup>since the original "Flash" entry</sup> This "Flash" record was the only means of determining document numbers in order to retrieve the material <sup>from</sup> ~~out~~ of the document file.

SECRET

Approved For Release 2004/09/23 : CIA-RDP84-00951R000300040002-5

28

Although lists of "Flashed" reports were periodically distributed to the classifiers-- and the lists grew-- the classifiers were always reminded to glance at the current documents to guarantee that they were sufficiently covered by the codes originally established. Changes in the ISC as well as wider subject coverage in the series did necessitate added codes.

The "Flash" system finally outlived its usefulness. Irregularity of issuance of certain series, the manual labor involved in maintaining the "Flash" book (for a period one copy was maintained in the Reference Branch also), the nuisance of not having a source card for every document, and the advent of the revised Intellofax system--all combined to bring about its demise in 1960.

(5) The Abstracting Program

[redacted] was very proud of his central reference facilities, and by late 1949 he felt that OCD was on the track of a "far more effective solution to providing analysts with quick retrieval of intelligence information than has ever, anywhere, been achieved before." He devoted 32 pages to a definitive description of the Intellofax System, entitling his monograph Central Reference Facilities. Status (1 November 1949) and Objectives. <sup>35/</sup> [redacted] which became a classic study in OCD. (He had prepared this paper at the request of the Chief, Coordination Operations and Policy Staff [COAPS-successor to ICAPS]. He in effect rejected a Management Staff proposal that the Library classification functions be decentralized and placed in substantive units of ORE and OSI.) <sup>36/</sup>

In his usual dynamic <sup>manner,</sup> approach, [redacted] had <sup>previously</sup> briefed specialists in ORE on the potentialities of the Intellofax System and how analyst participation in the growth of the file would benefit the system and therefore the whole Agency. In other words, he was asking analysts if they would like to contribute abstracts to the file. He stated that only the specialist could decide which were the important documents bearing upon his field of specialty and only the specialist could write competent abstracts of such documents. In January 1949 the Turkish desk began selecting and abstracting the most important documents on Turkey. OSI also commended operations on a trial basis in

February, and the [redacted] of ORE followed shortly thereafter. A so-called contributor code was punched into column 21 of the IBM card so that if a specialist ever wanted to retrieve only his own abstracted material, he could do so. ~~(Historian's note: (this seldom occurred.)~~

STAT

OCD meanwhile continued to write abstracts of a table of contents type for publications covering a wide variety of subjects and areas. \* Much as he had fostered and approved of the abstracting program, [redacted] became concerned about the rapid growth of these files in Intellofax. By the end of 1949 there were 18,047 abstracts (OCD<sub>λ</sub>-2847; ORE<sub>λ</sub>-6245; OSI<sub>λ</sub>-8955), and they were growing at a staggering rate<sup>37/</sup>. He warned that each extension of the system to a new group of specialists involved difficult adjustments, revisions, and expansions in the classification scheme, required more typists, and could be accomplished only by day-to-day hard work. How true! [redacted] spent a large proportion of her STAT time in these early years working on changes and expansions of the ISC to satisfy the needs of new contributors to the abstract program. Area codes for three of the Near Eastern countries were expanded to take care of provincial divisions. And as it turned out they were never used for retrieval.

The abstracting program mushroomed from its beginnings in

\* On pages 23 and 25 of the Intellofax study, [redacted] provided samples of OCD, ORE, and OSI abstract cards. STAT

37/ statistical Reports (29, above)

3 /

1949, reaching a peak in the early 1950's. Other desks joined the program in 1950 and 1951. Some of these desks even set up their filing systems according to the ISC. ORR contributed 16,558 abstracts in 1950 and 10,695 in 1951. OSI contributions amounted to 20,186 and 20,715 in those 2 years. <sup>38/</sup>

However, a downward trend began in 1952/53 because specialists were not interested in spending their time learning how to use the ISC correctly for in-depth indexing. The Physics and Medicine Divisions of OSI continued as heavy contributors but finally ceased abstracting in 1954 and 1955, respectively. <sup>In 1958</sup> ORR/Shipbuilding became the last ORR component to stop input. <sup>39/</sup>

OCD management had always hoped that these contributions would preclude the indexing of the same documents by the OCD classifiers. <sup>\*</sup> This was never possible, for the specialists frequently extracted and coded only <sup>e</sup> that part of the document that interested them. So some duplication continued; both IBM cards would turn up on a machine run if the same codes had been used (and there was no guarantee of this). In such a case, the OCD classifier or the librarian in screening the cards before an Intellofax tape was made would

25X1A5A1

\* A [redacted] study of "Information Processing Needs in the CIA" refers to these noble if somewhat unsuccessful efforts of OCR to harness the specialists' indexing skill. The 25X1A5A1 [redacted] consultants regretted that the problems could have been solved without abandoning the total effort and that therefore the indexing capability of substantive specialists was no longer substantively exploited by OCR. <sup>40/</sup> [redacted] "Information Processing Needs in the CIA A Preliminary Appraisal" 10 March 1961 SECRET CRS Historical Files)

(6) Cables

OCB management early in the Intellofax history decided that cables and telegrams would not be considered a part of the central reference system for subject/area retrieval. There was no question as to their current intelligence value, but OCB did not consider them vital to retrospective searching and therefore felt it was uneconomical to index the enormous cable flow. This philosophy carried throughout the years of the Intellofax System, although there was a brief ~~study~~ of a cable indexing experiment in 1963/64.\*

25X1A9A

[redacted] in his November 1966 study entitled "Choosing the Director's Central File System" said

The most noteworthy omission to the OCR file holdings is of noncodeword cable traffic. . . This omission of a major intelligence input is not the serious deficiency it might at first sight appear. The substantive content of most cables is of transitory value. . . The current intelligence analyst is particularly insistent on keeping cables close at hand in his own files during the useful intelligence life of the cables. He could not risk reliance on OCR for the short retrieval times that current intelligence requires. The subject will deserve reexamination when it becomes technically feasible and economically practical for analysts to interrogate central files from remote query stations and recover needed documents within the time frame in which current intelligence operates.

(a) Machine Support

(1) The Batch System

In August 1948 OCD management decided that a review of the existing ~~and~~ contemplated document handling procedures should be made with a view to determining if such procedures could be modified to expedite the distribution, machine classification, and indexing of documents pending the

25X1A9A

fulfillment of T/O requirements. [redacted] of Administration

25X1A9A

and Management Office worked closely with [redacted] in setting up a detailed procedure for the use of multilith mats in controlling and indexing intelligence documents. This was the beginning of the so-called "Batch System," which was modified many times during the next 19 years of the ~~Interlofar System~~.

A batch usually contained in one envelope 15-20 documents of like source. (This was similar to the organization of the dissemination function in the Liaison Division. The classifiers were not organized by source breakdown until April 1952.)

Put into operation in December 1948, the system

included the complete processing cycle of dissemination, distribution, indexing, key punching, and final filing of the documents in the Library document files. The bibliographic information for

half of the mat

a given document was typed on a multilith mat, which had on the lower a pre-printed distribution ladder for dissemination points. (See Figure 4)

This mat was the basis for the preparation of control slips (a cutoff IBM card) to be attached to each distributed copy of a document. One control card became a source card (see page 45).

Machine Division 1947-54 Job: 60-548/1 58-98/3

The classifier used one of these control slips on which to write the necessary codes for ultimate key punching. The typist prepared another multilith mat to be married with the punched IBM card. In February 1953 a Code Sheet was adopted for the use of the classifiers; thus the codes for all the documents in a given batch were recorded on one sheet, instead of <sup>having</sup> on a separate control slip for each document. The duplicate preparation of multilith mats continued until 1956, when a revised batch system eliminated the preparation of control cards for distribution purposes. \*

In September 1949 each classifier was assigned an Intellofax stamp bearing his individual number. Used instead of the classifier's initials, the stamp was affixed to three places: (1) ~~on~~ the face of the document to indicate that indexing had been completed; (2) ~~on~~ the control slip for the codes, so that key puncher could question a classifier, if necessary; and (3) ~~on~~ the Batch Control Sheet (see Figure 5), <sup>which</sup> ~~that~~ stayed with the group of documents through the various processing steps.

As the Intellofax System grew, it became more involved, and procedures were constantly revised and, <sup>presumably,</sup> ~~hopefully~~ improved. MD and Library personnel worked hand-in-hand in developing better and faster methods of processing the document flow and in <sup>12/</sup> taking care of users' needs. A procedure had to be written for every exception.

\* See history of dissemination in ~~the~~ chapter <sup>11</sup> on the Document Division Machine Division Intellofax Procedures 1949-55 (in CRS Historical Files <sup>12/</sup> of Intellofax)

For example: Extra IBM cards were printed for a number of offices-- Top Secret Control so that that office could set up its own Source Card File;  <sup>CCR</sup> ~~Contact Office~~ for every  document ~~codes~~ so that the Intellofax cards could be matched with  own contact card (~~and~~ this procedure continued until 1967); Reference Branch of the Library for every finished intelligence and basic intelligence (encyclopedic type studies) document for setting up a cumulative index by subject, area, and title (this stopped in 1953); and ORE/ORR and OSI offices that were engaged in the abstract program (see page     ). A special procedure was written for loan documents that were to be microfilmed. If more than 14 subject codes appeared on the control slip, the classifier wrote "MATS" on the Batch Control Sheet opposite the CIA control number in the "coded" column to indicate that additional Intellofax cards were needed.

(2) The Microfilm Program

One of OCD's problems was <sup>to</sup> that of keeping the Library operating at a maximum peak of efficiency. The Intellofax System had made available a greater volume of library document references to a larger number of requesters than had ever before been possible. The increased output of the System had resulted in a corresponding increase in requests for the documentary materials referenced. In wishing to offer maximum service to all offices, the Library was faced with the dilemma of coalescing two variations in point of view as to these services. On the one hand, some of the Library users insisted on an inviolate set of documents in the Library at all times. On the other hand, some insisted on the availability of library materials to their respective offices upon demand.

In answering this criticism by an ORR analyst, <sup>Joseph</sup> [redacted] wrote: <sup>LB</sup> 25X1A9A

We clearly recognize the need for ensuring the availability of a master set of documents; however, keeping an original document collection poses problems of filing, space, circulation, and reference which are almost overwhelming.

With 617,562 intelligence documents on file (but not all indexed) in the Library by September 1950, space had also become a serious problem. There was no doubt in anyone's mind that microfilming was urgently needed.

<sup>LB</sup> Memo, Librarian to [redacted], 6 April 1951  
 sub: Techniques and Methods. ~~SECRET~~  
 U. (in Library 1949-51  
 File: 58-98/1)

In March 1950 the Library began experimenting with a microfilm and print procedure, and by mid-1951 it had begun to microfilm all single-copy material (10 percent of the receipts) on 35mm reel film.

MD and the Library cooperated in developing the best sort of system to solve the document storage and retrieval problem. In

25X1A9A  
25X1A5A1

January 1951, [ ] and his Deputy, [ ] examine equipment at [ ] where 16mm microfilm was mounted into an IBM aperture or window card. This system allowed each document that was microfilmed to become a separate entity in itself and not just part of a reel, as was generally the case in most microfilm applications up to that time.

25X1A9A

In October 1951 [ ] that the problem was urgent and proposed that the Library microfilm all incoming documents, keeping a copy of the document as well as the microfilm. The latter would be available at all times both for viewing purposes and for reproduction in cases where the requester wished to retain a copy. On 19 December 1951 the ~~Project Review Committee~~ <sup>PRC</sup> authorized "microfilming of all significant incoming intelligence documents" and approved funds in the amount of \$16,700 for the initial purchase of equipment and in the amount of \$62,285 for the annual costs of personal services and supplies.

Research and testing continued throughout 1951, 1952, and 1953. At a CIA Budget hearing in October 1953,<sup>18/</sup> Dr. Andrews stated that MD's prime job was to keep pace with new developments all over the country, but that the most important research then at hand was to develop a microfilm processor that, in conjunction with the Intellofax equipment, would ensure that the Library would give to the analyst the documents he asked for.

At no expense to the Agency, but at OCD's suggestion, the 25X1A5A1 undertook the development of a new machine to reproduce prints of microfilm negatives mounted in IBM-Filmsort (aperture) cards. Because no other machine existed at that time that could perform the necessary task for OCD's microfilm project, Dr. Andrews requested an expeditious procurement of the automatic one-step reproduction equipment (Photostat Expeditor) at a cost of approximately \$3,950.<sup>49/</sup>

Microfilming of incoming documents began officially in March 1954 with the following equipment: two Recordak Model D Planetary microfilm cameras for the purpose of making initial microfilm reels, three Disbold film processors, one Microtonics Film Printer for copying the original reels (one copy of the reel was placed in the Vital Documents Repository), three Filmsort "mounters" to cut the microfilm reels and install the frames in the aperture cards, and one Photostat Printer-Processor to make positive prints from the aperture cards.

<sup>18/</sup> O.C.D. Topics to be Discussed in CIA Budget Hearings, 22 Oct 53. S. (in Chrono 1953. Sub: 58-98/4)  
<sup>49/</sup> Memo, AD/CD to Chief, Contracts Branch, P & SO, 20 Nov. 53, sub: Request for Purchase of Photostat Copy-Card Filmsort Type Machine. C. (in Chrono 1953. Sub: 58-98/4)  
 Approved For Release 2004/09/23 : CIA-RDP84-00951R000300040002-5

Approved For Release 2004/09/23 : CIA-RDP84-00951R000300040002-5

The aperture card (see Figure (2)) was a punch card that had information identifying the microfilmed document printed across the top and 16mm film images of an intellofaxed document mounted in apertures (openings on the right-hand side of the card). Aperture cards varied in that a single card might contain one, two, three, or four apertures. Each aperture contained a maximum of two film images, each image being a page of a document. The basic procedures of microfilming documents did not change materially until 1968 when 35mm film replaced 16mm.

25X1A5A1 A screening committee of librarians and machine people, and chaired by [ ] of the Analysis Branch was established to scan all documents at the intake point and to work up proper procedures. The first documents microfilmed in March 1954 were State Department despatches. These were followed in April by Air Force reports (from an original ozalid copy, which had to be returned to the Air Force within 48 hours); by Army and Navy reports in July; and by the last segment ~~CIA reports~~ in September. <sup>51/</sup>

With full-scale microfilming in effect, the Library and MD decided late in 1954, not to microfilm NODEX documents because their contents did not meet indexing standards. In April 1955 this decision was amended so the microfilming would occur only for those NODEXES that were single copy, required further routing, contained enclosures, or were of CIA origin; thus ensuring an inviolate copy in the Library. In the set-by-step batch procedures established for the flow of documents, microfilming

\* Detailed procedures of microfilming were outlined in CIA/CR 25-3. <sup>50/</sup> CIA/CR 25-3, December 1959. ~~see~~ Reference Aid on Machine Support Services. C. in CRS Historical Files. <sup>51/</sup> Intellofax Chronology - Appendix B

47

occurred after indexing, so that ~~NODEX~~ determination could be made first. This had one big disadvantage in that the microfilm of an indexed document was not on file until after all other processing had been completed.

Print service from the aperture file became the responsibility of the Circulation Branch of the Library where they were filed by control number assigned to the document. 35mm reel film was used for documents over 50 pages in length. Bulky and oversized documents were not microfilmed. Any equipment developments or problems were the responsibility of MD, such as experimenting with improved aperture card positioners for Filmsort viewers and with better methods for printing documents from the microfilm viewers.

\* See page 45 for microfilm designators assigned to control numbers.

(3) Machine Processing

After the microfilm program was implemented, MD inaugurated a system of using work cards to prepare Intellofax cards and aperture cards. A work card was a blank brown punch card. For the preparation of Intellofax cards, MD punched <sup>one</sup> (from the code sheet) one subject and main area code into each work card. It was possible that several work cards were prepared for a single document- the average being four. ~~The Intellofax work cards~~ When the printed white Intellofax cards (made by PSD from the multilith mat) were received, the punched codes were transferred from the work cards to the corresponding Intellofax cards ~~containing the~~ <sup>the original white Intellofax cards were destroyed,</sup> containing the bibliographic citation. After the above processing was completed, MD used the Intellofax work cards to prepare statistical records and eventually sent the cards to the Vital Materials Repository (VMR) at the rate of \$66,000 annually. These cards <sup>containing the</sup> ~~could be used in~~ <sup>an</sup> emergency ~~cases~~ <sup>to reconstitute the punched information they contained</sup> in the Intellofax File, but <sup>only</sup> the punched information and not the bibliographic citations.

One work card was also prepared from the Batch Control Sheet for each microfilmed document. Coded information (document control number, date of filming, number of pages in the document, the sequence number and the reel number) was punched into a work card first

rather than directly into a blank aperture card because it was more efficient to punch one work card for each document, select the number of aperture cards to cover the total number of pages in the document and then transfer the punched codes by machine from appropriate the work cards to the aperture cards. The document control number printed across the left end of the ~~ap~~ each aperture card facilitated the manual sorting of the cards for filing by document control number in the Circulation Branch, Library

Consumer service to the Intellofax File was provided on the was provided on the Intellofax File in the form of Intellofax tapes (see page 5). The tapes were lists of bibliographic citations on the indexed documents, covering subjects, areas, dates, security classifications and other details specified by the requester. The tapes were arranged in the sequence specified by the requester--that is, by subject, area, ~~by / of / by~~ source, or date. unique  
 The Intellofax tape was prepared by the facsimile process as described on page 5 until 1959. *Ken Thompson, developed this process from MD until he joined CIA's Intellofax Development Group in 1958, developed in-house a much*  
 faster Card List Camera. 5/ By this machine the printed data on the cards were photographed on a 4-inch strip of photo-sensitive paper, at the rate of 3,600 cards per hour. After the data from the cards The tape was then inserted in a modified Photostat Expediter (had no exposure unit), a machine that developed, fixed, washed, and dried the tape in a single operation. The machine could process two tapes simultaneously--350 feet of single tape hourly--or a maximum of 700 feet of tape hourly.

43

f. The Source Card File

An important by-product of the Intellofax System was the establishment of a Source Card File. The Library early recognized the need for a card catalog of document sources, similar to the author catalog for books. In the first coding efforts of 1948 prior to the Batch System, the classifier wrote the ISC codes on a 3"x5" form on which the typists had typed the bibliographic data. With the inauguration of the Batch System, MD provided the Library with a "cut" Intellofax card or control slip for the Source Card File.

This File served several purposes: (1) inventory of document holdings, (2) identification of a document, and (3) location of a document. Requesters looking for a specific document often did not have the document number but might know the source and/or year. The cards were filed by source of origin with further divisions by year of publication followed by specific post or agency breakdown and document number. A brief title description of the enclosure and a notation whether it was received or not, ~~received~~, microfilmed or not, ~~microfilmed~~, appeared on the card. After the inauguration of the microfilm program in 1954, the approach to the aperture card was only through the document control number that appeared on the source card:

- "D" + control number---on 16mm aperture card
- "C" + control number---on 35mm reel film
- "V" + control number---not microfilmed and in hard copy

The source card that was prepared for ~~NODEXES~~ contained only an abbreviated bibliographic entry, that is, source, document entry, date, and security classification. The title and country were not entered. This abbreviated notation saved typing time, but it created problems when librarians searched for document identification. By March 1961 a full source card entry was made for all ~~NODEXES~~ that were microfilmed, the so-called ~~NODEX~~-M category-- primarily CIA documents that were not indexed.

For further discussion of the Source Card File see 25X1A2G page 81, the ~~Impact~~ of  on Intellofax.

Prospectus for Index to Intelligence Periodicals, Oct 52. S. 5.

g. The Intelligence Publications Index \*

Equally as important as the Intellofax System in the history of OCR's document and indexing schemes was the IPI. Because the IPI was actually a corollary to the Intellofax System, its history is dealt with here.

Although the Intellofax System had included finished intelligence documents since early 1949 with a special "fin intell" punch added to the IBM card, OCI made a strong plea in 1951 for a separate printed index of finished intelligence studies. The request was all-encompassing and included intelligence studies and featured articles in intelligence periodicals, up through Top Secret, published by Intelligence Advisory Committee (IAC-successor to IAB) agencies, certain subordinate commands, and [redacted] intelligence organizations.

25X1C8A

25X1A5A1

Library personnel made trips in November 1951<sup>5/</sup> to the New York Times and to H.W. Wilson Co. to review their respective procedures. [redacted] was recruited from Catholic University where she had been involved in the preparation of a similar Readers' Guide type of index. One of her first tasks as chief of the Editorial Section of the Book Branch of the Library was to prepare a prospectus to the Index to Intelligence Periodicals. Issued in October 1952, it listed as its purpose:<sup>4/</sup>

To establish a current, continuing, cumulative, subject index to articles and studies contained in a selected list of the more important intelligence periodicals heretofore not covered by cumulative indexing

Frequency was to be monthly, with semiannual or annual cumulations.

\* A full set of the IPI is kept on file in the CRS Document Library.

Reaction to the proposed index throughout the Agency and

the intelligence community was most favorable, <sup>and</sup> with valuable suggestions <sup>were</sup> received on coverage and format.

Issue No. 1, dated January 1953, was entitled Intelligence Periodicals Index, <sup>but the title</sup> and was changed with the November issue to Intelligence Publications Index, when, after much urging <sup>from</sup> by OOI, finished intelligence studies <sup>also</sup> were included. <sup>in addition to the</sup> ~~as well.~~ ~~arranged~~  
~~Arrangement in the enlarged IPI was by subject and area in one~~  
~~alphabetic sequence.~~

← The IPI was a conventional library index, following American Library Association rules for bibliographic entries. Arrangement in the enlarged IPI was by subject and area in one alphabetic sequence. The IPI staff opted for a semi-annual cumulation as easier to prepare than an annual.

In January 1955 an important change in format occurred. The index was arranged in three sections: a classed subject index with area subdivisions, thus putting related subjects into a compact section of the index; an area index with broad classed subject subdivisions; and a list of series by source and title. The area subdivisions of the subject index, the countries of the area index, and the bibliographic sources of the monographic series were arranged in alphabetic sequence.  
←). Beginning with the January 1959 issue, a black border appeared on the edges of the area index for easy identification.

The security classification of the IPI changed several times: it began as ~~SECRET~~ in 1953; from November 1953 <sup>to 19</sup> it was ~~CONFIDENTIAL~~

The National Intelligence Surveys (NIS) (see Appendix B). were indexed from 1953

until 1958; classified US research and development publications were included from 1957<sup>to 19</sup>, 58; FDD publications were selectivity indexed after 1955; selected non-NPIC photo interpretation studies were included after 1960. In 1956 a request to index the [ ] Daily Reports in the IPI was rejected as not feasible, because they did not fall into the criteria of finished intelligence. (IPI staff was constantly making decisions as to what constituted "fin intell.") At the request of the DD/I in 1955, the IPI staff began to provide citations of all new monographic intelligence, including the NIS's, for listing in the back of the OCI Current Intelligence Weekly Summary.

25X1A7B

The 1957 Library Consultants' Survey was most favorably impressed with the IPI-- it was a conventional Library tool ! Nevertheless, along with other programs, OCR conducted its own survey of the IPI to determine its usefulness. In 1958, a team composed of Library and Document Division personnel conducted personal interviews with representatives from each <sup>USIB Committee on Documentation (CODIP)</sup> member agency. Questionnaires were sent out to recipients ~~not~~ in the Washington area. The following conclusions were

- 25X1A9A \* ~~See Chapter on the Library 1957.~~
- \* Members were: [ ] Chief Reference Branch and former IPI editor; Joan Brahm, DD Staff Assistant; [ ] C/Analysis Branch, DD;
- 25X1A9A [ ] C Training Officer and former IPI editor; [ ] IPI editor at that time.

reported to CODIB in December 1958: <sup>57/</sup>

- a. The IPI is used primarily as an announcement of current accessions; therefore, researchers want a printed index published regularly.
- b. Since this is the only publication of its type in the intelligence community, no one wants it discontinued.
- c. Users are satisfied with the coverage, content and format, and cumulation policy.
- d. Researchers desire the availability of a bibliographic list-out of finished intelligence material for research purposes. Intellofax provides the quickest service and desired specificity. (In spite of this last conclusion, OCR managers decided in September 1960 that finished intelligence would no longer be indexed in the Intellofax System. See page 78)

Denouement

Studies were made on the possibility of mechanizing the IPI, but nothing ever materialized. The IPI, therefore, continued to be published as previously described. During the unsettling years of 1966 and 1967 due to decisions about <sup>a</sup> computer-based  (large-scale information storage and retrieval system) ~~for computer base~~ on top of continuing budget cuts, the IPI was a target for change or re-configuration.  was experimenting with a publication called SKAN (Subject Keyword Announcement) which was a computer listing of collateral documents on Communist China. OCR management debated whether the IPI should be incorporated into an expanded SKAN, whether the SKAN computer programs should be applied to the IPI, whether the Special Register KWIC (keyword-in-context) approach should be used, or whether there should just be a reduction in input, including an elimination of the subject classed section. <sup>58/</sup> None of these

<sup>57</sup> CODIB-D-22, 12 December 1958, sub: Intelligence Publications Index OVO. (in CODIB ~~1958~~ 64-341/2)

52

possibilities occurred. Instead, the IPI was prepared and published as it had been throughout the years. During an office realignment the IPI was placed administratively in the Title Indexing Section, Customer Services Branch, of the new Indexing and Services Division. <sup>59/</sup> It was actually the last activity to be phased out with the complete reorganization of CRS in 1967/68.

*September 1966*

Without any advance warning to the "outside world," an announcement signed by ~~the Director of Central Reference~~ <sup>The Director of Central Reference</sup>, appeared in the February 1968 issue of the IPI to the effect that no more issues would be published. After 15 years of continuous publication and with a T/O fluctuating between four and six, the IPI had earned its reputation as the only complete publication of its type in the intelligence community. Its size had grown from 146 pages in the 1953 cumulation to 454 pages in the last 1967 cumulation.

2. The Era of Interagency Cooperation

The 1950's were characterized by increased use of the Intellograf System by the Agency and non-Agency components at the same time that OCR was doing some soul-searching regarding the System. The heavy impact that the Library Consultants' Survey (1957) and the resulting Task Team Reports (1958) had on the Intellograf System is discussed in the chapter on the Library. Interagency cooperation that was not successful in the 1947-48 period began to loom on the horizon in the mid-1950's. The following pages will deal primarily with the close working relationships with the Air Force in the MINICARD Project and with all ~~the~~ of the Defense agencies; in common documentation problems of storage and retrieval.

I think this should be done for the...

a. Cooperation with Air Force, Army, and Navy's ISC Especially

A Working Group on Central Indexing was established early in 1952 by the Economic Intelligence Committee (EIC) Subcommittee on Requirements and Facilities for Collation. <sup>60/</sup> It was dissolved by the end of the year because coordinated IAC policies for a single classification scheme and common cataloging policy still seemed to be unattainable at that time. However, sharing of indexing and reference services were already being developed <sup>CIA and</sup> between the Army and the Air Force, particularly in the G-2 and A-2 intelligence libraries respectively.

As of January 1953 the G-2 Library began to depend on the Intellograf System for information <sup>that</sup> which could not be answered solely from Army intelligence reports (IR's). The G-2 Library then ceased cataloging and retaining permanent file copies of non-Army documents. It also received unpunched IBM cards containing abstracts covering

basic intelligence and "Flashes." <sup>61/</sup>

1953 saw the beginning of a long and close working relationship between the Air Force and CIA in the development of a common system of documentation. The Air Force was the first agency to show a marked interest in adopting the ISC as a workable classification system for their large-scale MINICARD Project.

(see page 63). <sup>ON</sup> ~~As of~~ 15 October

master  
OCD began to write ISC codes on the original A-2 ~~master~~ ozalids  
that were sent over to the Analysis Branch daily. Also at the request of the Air Force, OCD agreed to place subject and area codes on all CIA intelligence information reports, beginning in December. This necessitated a satellite operation of three classifiers and three typists from the Analysis Branch in L Building, where CS and OO multilith mats were reproduced. These procedures enabled the Air Force to capitalize on the CIA indexing effort rather than to set up a duplicate indexing system of its own. The Directorate of Intelligence, Air Force, issued a status report on 23<sup>d</sup> December 1953 to all Air Force Commands describing the CIA/Air Force Intelligence Library <sup>62/</sup> Reference System:

- 61//Memo, G-2 Librarian to CIA Librarian, 14 Dec 52, sub: Services Available from CIA to G-2. Restricted (in Library 1952 58-98/1) and
- 62//Memo, CIA Librarian to G-2 Librarian, 30 Dec 52, sub: CIA Library Services to G-2. S. (in Library 1952 Job: 58-98/1)
- 63//The Air Force Intelligence Library Reference System, 23 Dec 53 C. (DD/I 1953 58-98/2)

Such a reference system will in the end provide the key by which the latest developments in machine techniques and equipment may be employed to quickly select and provide all available information to meet the specific needs of the intelligence analyst. A study at this Headquarters has resulted in a recommendation that the information codification system in use at CIA be adopted for Air Force-wide applications.

STAT

[redacted] comment to the DD/I was: "This is a first step, and a major one, toward the evolution of a uniform system which may someday extend to all members of the intelligence community."

The appearance of Library Subject and Area Codes, so identified on the last page of CIA documents, served not only the Air Force but also brought to the attention of researchers, particularly within CIA, the existence and availability of the ISC. In addition, it was hoped that these notations would offer the specialist in a particular field the opportunity to raise questions as to omissions or errors in coding. In 1956, <sup>the Analysis Branch dis-</sup> coding continued directly onto master Air Force ozalids and CIA multilith mats <sup>was discontinued</sup> because the Air Force did not feel the need any longer (they were starting with their <sup>own</sup> ~~MONITOR~~ efforts) and CIA specialists had shown little interest.

When the microfilm program began in the spring of 1954, the Air Force ozalids were microfilmed, indexed, and returned within 48 hours with a 16mm reel of film. Similar procedures were set up in August 1954 with the Army and in January 1956 with the Navy, but only for documents with single-copy enclosures. <sup>63/</sup>

After the material was microfilmed, OGD reproduced enough copies ~~for~~ <sup>single-copy enclosure</sup> of the document for internal CIA dissemination. During a <sup>4-</sup> ~~four~~ month period, August ~~through~~ December 1955, 1300 enclosures to Army

such enclosures were readily filled from these files. This was a

63/Procedure Manuals (15, above)

great relief from the interlibrary loan approval.

Approved For Release 2004/09/23 : CIA-RDP84-00951R000300040002-5

In April 1956 MD was given permission through an interagency agreement to furnish NSA on a reimbursable basis with a film copy of all material received and microfilmed by OCR, with the exception of CIA Internal Use Only. IBM punched cards were also furnished for control purposes so that NSA could prepare its own aperture cards. This agreement, still in effect in 1973, has saved duplication on NSA's part in the <sup>64/</sup>photographing of documents.

Toward the end of 1959, OCR began to receive from the Army Actifilm copies of single-copy documents with enclosures, to test the feasibility of interfiling this material with OCR's aperture cards, thus avoiding <sup>duplicate</sup> filming in both Agencies. MD's experiment with this system proved successful, and all Army Actifilm was accepted for input to Intelifax film storage.

Cooperation with the Air Force in the use of the ISC included CIA's willingness to provide a training program for Air Force personnel in the use of the classification scheme. Thus, in July 1954 the first Air Force analysts participated in the Analysis Branch's training program--a program that grew and continued for the Air Force until it was able to index and retrieve information from its Minicard operation. During the 1950's more than 150 Air Force indexers and disseminators were trained. As the ISC became more widely known and accepted throughout the community (after all, ISC subject and area codes were appearing on many printed documents) and as the word spread about CIA's formal training program, analysts from other Defense agencies were also enrolled in the class, which usually lasted 3-4 weeks for complete indoctrination in the ISC and the whole Intelifax

This exposure to CIA's Intellofax System and the Defense agencies' acceptance of the ISC as the best available classification scheme resulted in urgent requests for copies of the ISC. The first official printed version for outside consumption appeared in 1954.

25X1A9A

[redacted] Deputy Assistant Director(DAD)/OCD and Chairman of AHIP, in August 1955 called to the attention of the committee members that the Clark Task Force on Intelligence Activities of the Hoover Commission had recommended that all departments within the Defense Establishment and the Department of State adopt the single index system based on the Intelligence Subject Code now in use by the CIA and Air Force libraries." 65/ Soon thereafter A-2, G-2, Navy's Office of Naval Intelligence (ONI), and NSA endorsed the ISC for adoption and use by the intelligence community. At the same time they established working groups for the revision of pertinent sections of the ISC. State Department's answer was typical: "Theoretically, a uniform classification code for intelligence documents is highly desirable, but the Department cannot substitute its own classification code which encompassed more than subjects of intelligence interest." 66/

25X1A9A

In the meantime, [redacted] proposed a Utopian plan for an integrated documentation system prior to the implementation of Minicard, if accepted. 67/ Each agency would index its own documents according to the ISC, CIA would prepare the punched IBM cards for the central Intellofax file, and would return source cards to the originating agency. Each agency would file its own documents,

67/ [redacted] Proposed Plan for an integrated documentation system C File: Hold

58

CIA would mount the film in aperture cards for a total aperture card file, and CIA would return an aperture card to the participating agency where required. CIA's efforts of common service were outlined as: (1) central IAC source file; (2) central IAC control number file; (3) central aperture card file, (4) Intellofax subject card file, (5) Intellofax tapes for all agencies on request; and (6) print service from central aperture files on request.

This plan also included a common numbering system, a prerequisite to any systematic cooperative IAC library program, and a common document format. By September 1956 all the IAC agencies except for State, which to date has never complied, had adopted a common control number system. <sup>68/</sup>

\*

In OCR this seven-digit control number served as a filing device for the aperture cards and for the source cards. The IAC also adopted a modified common intelligence document format with uniformity on masthead and size of paper.

AHIP working groups devoted many hours to the agreement and final adoption of the common numbering system and format. <sup>69/</sup>

The other aspects of Colonel [redacted] plan, however, were never more than a dream.

25X1A9A

(1) Revision of the ISC

In late 1955 the Air Force completed its revision of the 400 (Air) chapter of the ISC, and it was adopted by both CIA and the Air Force. The Army Working Group submitted to CIA a draft of an ACSI Subject Code, which was

\* A 10-digit meaningful control number replaced the seven-digit number in 1962/61. <sup>68/</sup> AHIP-M-25, 19 June 56. C. File: Ibid. <sup>69/</sup> AHIP-M-28, 16 Aug 56. C. File: Ibid

of the entire ISC with emphasis on the military, scientific, and technical sections. Navy prepared a first draft of a revised 300 chapter of the ISC. Beyond the IAC, SHAPE Headquarters in Paris adopted the ISC for its document library in 1956.

25X1A9A

In November of that year [redacted] deputy to the Chief,

25X1A9A  
25X1A6A

← Analysis Branch, and [redacted] from the Air Force were sent to [redacted] for the purpose of training SHAPE

personnel and to recommend a working library system. [redacted] 25X1A9A

stayed on for an additional week of in-depth ISC training. (In 1959 Annadel Wile, <sup>made as to</sup> visited SHAPE as a follow-up and learned that, although a completely new ISC would be issued in 1960,

25X1A9A

SHAPE had no intention of so informing the NATO countries using [redacted] visit to seven NATO countries, therefore, was to discuss the ISC. As late as the mid-1960's, SHAPE documents still carried the old ISC numbers.)

25X1A9A

Not until 1957 did AHIP appoint a <sup>official</sup> Working Group on the Intelligence Subject Code (WGISC), with [redacted] as chairman. 70/

And then began the long process of completely recasting the ISC to make it a uniform classification scheme (dreamed of and unsuccessfully tried in 1947). Under the terms of reference, CIA assumed the major responsibility for revision and agreed to utilize an outside authority on hierarchical classification for advice and guidance.

25X1A9A

[redacted] Analysis Branch training officer for the ISC, was assigned the task full-time. He worked closely with Richard Angell, classification authority at the Library of Congress, in establishing the basic principles for good classification. Although a time schedule for revision of the ISC

60

February 1960. <sup>71/</sup> ~~\_\_\_\_\_~~ in ~~contrast to the 1957 edition~~ <sup>an Unclassified edition</sup>  
that ~~was Confidential.~~

For the first time in its history, the ISC was published not  
under CIA authorship but <sup>as a USIB</sup> product. The agencies agreed to an  
Unclassified edition, in contrast to <sup>the most recent</sup> ~~the 1957 edition~~ <sup>which</sup> that was  
Confidential. <sup>1250</sup> copies were printed; <sup>with</sup> ~~copies~~ distributed <sup>externally</sup>  
as follows: Atomic Energy Commission-2, Air-300, Army-300,

25X1A6A

Federal Bureau of Investigation-2, Navy-250, NSA-10, and USIA-2.  
<sup>ments, such as</sup> \_\_\_\_\_ <sup>USIB permitted distribution to foreign govern-</sup>  
~~In the Introduction to the February 1960 edition,~~

~~Paul Berel, as chairman of CODIB, wrote: "The present edition,~~

<sup>72/</sup>  
The ISC retained its six-digit notation because

CIA and the Air Force were planning to use the ISC in the Minicard system,  
that had been designed <sup>for</sup> a six-character code. The seven major  
chapters were: 100-Government, Politics, and International Activities  
and Institutes, 200-Social and Cultural Structure and Institutions,  
300-Science and Technology, Engineering, 400-Commerce, Industry,  
Finance, 500-Transportation and Communications Systems, 600-Resources,  
Commodities, Weapons, 700-Armed Forces. The combining of military

<sup>71/</sup> CODIB-M-13, 9 June 59 (in CODIB 1959 64-341/2)  
<sup>72/</sup> Intelligence Subject Code 1960 (in ISG Historical Intellofax Files)

61

organizations and activities in chapter VII and the establishment of a single list of military weapons and equipment in chapter VI simplified the use of the ISC by the military services (and was actually the Air Force's suggestion).

Eighty-nine modifiers of three digits each were available in combination with the subject code. The Introduction explained that these were "a faceting device which can be combined with certain subjects to specify actions or states which affect these subjects."

25X1A9A

<sup>73/</sup>  
The Area Classification Code had been prepared under an AHIP/<sup>CODIAC</sup>GODIB Working Group, of which  was chairman.

The Code was designed to be used with a six-digit hierarchical alphabetic notation (Air Force) or with a four-digit non-hierarchical numeric notation (for CIA primarily, if the Intelifax System continued). The Code was organized into nine major area divisions. The last position of the notation was called an "indicator" showing either political affinity or a geographic unit. For example, Communist China was ACH00C or 1013; West Africa, A0000W or 1006. Only USSR and Communist China were subdivided completely to administrative or provincial levels.

<sup>73/</sup> Intelligence Subject Code  
Ibid

62

Even before the final acceptance of the revised ISC, CIA and the Air Force agreed to exchange their coding efforts. The former sent its Intellofax code sheets to the latter; Air Force's MINICARD code sheets were accepted for conversion into the Intellofax System. This exchange enabled the Analysis Branch to cease coding Air Force IR's and to free classifiers to support the MINICARD test. It also set a precedent for cooperative processing in the intelligence community. Beginning in June 1959, this exchange lasted until April 1962. Subsequent changes in the Intellofax and MINICARD Systems (1960 and 1961 respectively) increased processing time and manpower in CIA to prepare Air Force reports for Intellofax.

The Air Force sent the coded document (for conversion) almost 6 weeks after normal dissemination completed. This document was, therefore, not available in the aperture and Intellofax files for 8-9 weeks as opposed to 2-3 weeks for other sources.

The Document Division sent its senior personnel, upon request, for short periods in 1960, 1961, and 1962 to train g service personnel in the use

25X1A9A

of the revised ISC: [redacted] who had been responsible for conversion of MINICARD code sheets to Intellofax) to the Air Force Strategic Command in Omaha, and

b. Minicard Project

(1) Purpose and Development

25X1A9A

25X1A9A

The Machine Division's charter to keep abreast of the newest research and development in machine technology led [redacted]

[redacted] (with the Management Staff since 1950) in 1952 to investigate confidential new equipment being developed by Eastman Kodak for the

25X1A9A

Air Force. With [redacted] <sup>Asst</sup> resignation <sup>ed</sup> in September 1955 to join the staff of

25X1A9A

Eastman Kodak, his successor [redacted] as ~~Chief of MD~~ continued the close rapport with the Air Force in devising compatible methods for joint Air-CIA use of a multi-million dollar system known as MINICARD.

Four and one-half years of effort in overcoming problems in optics, photography, mechanics, and electronics ensued with Eastman. OCR's MINICARD Project was OCR's biggest system design effort in the office's history since the innovation of the Intellofax System.

From its inception in 1947,

the storage and retrieval capability of the Intellofax System had been increasingly strained by the flow of information until, by 1955, storage, retrieval, and costs problems were considered urgent.

The increased growth of the file had been accomplished by multiplication of IBM equipment rentals, storage units, and personnel. The rationale for CIA's interest in MINICARD was spelled out by Dr. Andrews in a 1955 memorandum to the Project Review Committee.

He recommended a contract for the purchase of MINICARD equipment at an estimated cost not to exceed \$330,000 in order to conduct "an early and large scale test of . . . data handling equipment. . . which it is believed capable of substantially improving CIA's Intellofax System." 76/

Approved For Release 2004/09/23 : CIA-RDP84-00951R000300040002-5

Eastman had developed an information storage<sup>retrieval</sup> system utilizing the microphotographic medium in the form of a piece of 16mm x 32mm <sup>film,</sup> called the MINICARD. (see Figure 7)

Eastman claimed that this provided for the first time a storage and retrieval system that could be searched electronically and that combined the mobility of punched cards with the compactness of microfilm. MINICARDS representing millions of pages of material could be machine organized in one file cabinet in such a manner that rapid retrieval was possible. The MINICARD System called for the retrieval of document images either for viewing or for the reproduction of hard copy. Retrieval would be by the same search parameters as in Intellofax--subject and area codes, source, date, and security classification. ~~Because there was no limit to the amount of index data (no 80-column limitation as with the IBM card) that could be used for any document, both CIA and the Air Force hoped that considerable "richness" could be achieved by generous indexing of names.~~

OCR anticipated that MINICARD would hasten and expand adoption of common data handling procedures throughout the intelligence community. The Air Force and CIA maintained a continuing degree of close cooperation on an almost daily basis with the mutually agreed objectives of achieving maximum compatibility, as a result of which they both anticipated the exchange of MINICARDS in an ongoing system. Because there was no limit to the amount of index data (no 80-column limitation as with the IBM card) that could be used for any document, both CIA and the Air Force hoped that

Approved For Release 2004/09/23 : CIA-RDP84-00951R000300040002-5

considerable "richness" could be achieved by generous indexing of names of people, organizations, installations, and locations. MD and OCD/OCR managers made frequent trips to Rochester to follow the developmental progress of the MINICARD equipment, which was in the blueprint stage.

25X1A9A

In the spring of 1956 [ ] was detailed to the Pentagon to assist the Air Force at its request in establishing detailed indexing plans and procedures, and three members of MD spent several months with the Air Force personnel in their study of the experimental equipment.

(2) Doubts

The Air Force negotiated an expansion of its contract

with Eastman to ensure the manufacture of a second set of equipment for CIA. <sup>TP</sup> The equipment arrived in stages, but the complete set was finally delivered in November 1958 <sup>to</sup> in specially air-conditioned rooms on the ground floor of [ ] Installation was completed in February 1959. <sup>TP</sup> During the period between the order date and delivery, several major modifications were made in the equipment. CIA was aware of them but had no legitimate basis for objection because CIA's program was appended to the Eastman Kodak/Air Force development program. The changes did, however, invalidate the earlier space and personnel estimates. Operating speeds on the duplicator, sorter, selector, and processor were substantially reduced. By the time the test phase arrived, the

25X1A6A

<sup>SI</sup>

139 #1

66

earlier expectations from MINICARD had been somewhat modulated. There was some feeling in CIA that extreme miniaturization which <sup>that</sup> eliminated manual access might prove inferior to the 16mm aperture card system. The combination of codes and images in the same card was questioned, as was the loss of the bibliographic Intellofax tape. The changed equipment specifications stimulated OCR's managers' belief that additional purchases would be required at an estimated cost of three to five times the cost in the original order, with an estimated equipment delivery of 1-2 years. Despite the increased pessimism, MINICARD, though untested, seemed to be the only alternative to ~~EAM~~ EAM equipment with the capability ~~(EAM and such was IBM punched card equipment)~~ claiming the 'of handling' OCR's task. Still prior to the test, senior classifiers expressed the thought that subject coding, the slowest phase of Intellofax, would be even slower for MINICARD because of the increased coding complexities. The pros and cons continued, but the final recommendation was that having <sup>already</sup> made a substantial investment in MINICARD and in spite of the reservations that had developed, OCR should make its own <sup>proceed with a test.</sup> direct evaluation and

(3) Test: Input and Retrieval

A test of the equipment and of several systems applications began in January 1959. In the meantime, MD had been photographing codes and the related documents for about 60-70% <sup>percent</sup> of the CIA information reports that had been processed into the Intellofax System.

25X1A9A

<sup>DAD/CR</sup> as Deputy Assistant Director of OCR <sup>(since September 1957)</sup> managed the MINICARD experiment.

67

As of April 1958 there was an estimated 13,000 master MINICARDS in the special file mechanically converted from IBM cards. The full line of MINICARD equipment was operated parallel but separate from the Intellofax program. A MINICARD Project Test Manual (dated January 1959, revised August 1959) spelled out the objectives and stated that the test was intended to find out the quality of the system, as interpreted by both OCR and its customers and as compared with the Intellofax System.

A test corpus consisted of a copy of each document distributed during January and February 1959—approximately 25,000 information reports containing a normal mixture of document categories by source, format, and enclosure variety, and with every kind of problem in subject coding and photography, including paper types, inks, size and color differences, and varying legibility. The documents were processed into both Intellofax and MINICARD, with codes and document images stored in separate but related MINICARDS. (The Air Force had already experienced difficulty in placing codes and document images on the same MINICARD.) A coding variable was the use of the revised ISC (the 1960 ISC in draft) for the MINICARD test and the old ISC for the Intellofax input and retrieval. (This also provided an unusual chance to test the revised ISC. Several weaknesses were corrected before the final printing.) This test required the services of 18 staff members for a period of approximately one year. The indexing staff, made up of some of OCR's most experienced people (four classifiers from the Analysis Branch and two from the Special Register, plus one reference librarian), operated in space contiguous to the Analysis

(ADG) \*  
 the aegis of OCR's Automation Development Group. The significance of the test lay in unique MINICARD coding techniques. This included rules for linking codes in phrases and for using clear text, ~~both of which were not possible~~ <sup>\*\* Neither was</sup> in the Intellofax System at that time.

The retrieval test began a year later, in February 1950, after input was completed. <sup>Two hundred</sup> ~~200~~ test questions included both live and simulated requests suggested by retrieval test personnel (two groups: the Composite Intellofax Group and a MINICARD Composite Group) and by other OCR, other CIA, and non-Agency personnel who were Intellofax users. Also involved were requester interviews to define and redefine questions and to check customer satisfaction with content and format.

(4) Findings and Conclusions

The test clearly demonstrated that subject control of information and the procedures employed, <sup>for</sup> ~~therein~~ were the principal areas to consider in the development of a successful system. The overall retrieval tests showed an appreciable qualitative advantage for MINICARD. Both systems combined retrieved 997 specific references, of which MINICARD obtained 788 or 79% <sup>percent</sup> of the total and Intellofax obtained 619 or 65% <sup>percent</sup> of the total. The retrieval groups concluded, however, that this superiority was attributable to

25X1A9A

\* ADG was organized with [redacted] from MD as chief in June 1958 after Task Team No. 12 on MINICARD recommended that OCR should have a continuing high-level planning and management staff to investigate new ideas. This staff reported directly to [redacted] <sup>30/</sup> Task Team No 12/4 in Task Team Reports, 1958. ~~CRS Historical Files. K-107~~ <sup>9/63-9</sup>

\*\* The Special Register had for many years in its indexing system been using clear text for abbreviations of organizations.

the coding and procedural techniques used and not to the equipment.

The Chief <sup>80</sup> ADG submitted a detailed study <sup>81</sup> outlining equipment and personnel utilization for the MINICARD test project and requirements for a full-scale MINICARD System. He recommended that the MINICARD equipment not be used in OCR.

25X1A9A  in his final report to the AD/CR <sup>82</sup> gave the following reasons for rejection, with which Mr. Borel concurred:

- a. The retrieval tests clearly showed that any qualitative advantage of MINICARD over Intellofax could be introduced into the Intellofax System with only minor revision of ~~current~~ <sup>existing</sup> routines and at a minimal cost.
- b. A substantial standby equipment would be required with MINICARD.
- c. It would be necessary to operate the MINICARD and Intellofax in parallel for not less than 7 years <sup>because</sup> ~~since~~ Intellofax could not be converted feasibly to MINICARD.
- d. The technology of storage and retrieval of information has advanced so rapidly that ~~"we believe"~~ MINICARD, even in its latest model, <sup>appears</sup> to be obsolescent.
- e. The economics of the MINICARD System <sup>were</sup> ~~are~~ prohibitive.
- f. Personnel required to operate the MINICARD System would number 47 more people than we ~~presently~~ <sup>currently</sup> use to operate the Intellofax System, not including the extra

C. (in MINICARD Folder ~~71-21/1~~ 64-341/3)

analytical personnel demanded because of the improved coding technique.

- g. The original space requirement was of the order of 100 square feet per MINICARD installation. Our findings indicate that 3,007 square feet would be required for an installation of the size necessary to handle ~~our~~ <sup>the</sup> loads.

The DD/I concurred in OCR's conclusion and directed the AD/CR to proceed with plans for the disposal of the equipment, ~~space,~~ and supplies on hand. <sup>83/</sup>

It was incumbent upon Mr. Borel to explain OCR's rejection of the MINICARD System to CODIB. His summary and decision appeared as follows: <sup>84/</sup>

Our findings are negative. This conclusion is based only in part on our findings that the MINICARD System would not enable us to give substantially superior reference service over that possible with our present system. . . . The expectation of economies in the Agency from a common community program for one-time processing, common code, and identical equipment and procedures has not come about and from all indications would not come about through MINICARD, whether this Agency adopted it or not. Technological advances since 1955 have been such that alternative systems have been presented and no other Agency in the USIB other than the Air Force plans to use MINICARD. One of the aims of CODIB has been the stimulation of compatibility of systems considered, and this goal has by no means been reached: to hope for identical systems is just not realistic. . . . As a result of the test, the Working Group concluded that MINICARD did not live up to what had been hoped for in terms of our own problem. There were demonstrable advantages, but important disadvantages were also discovered. As a consequence the Working Group did not recommend a conversion from Intellofax to MINICARD, but recommended instead the modification of Intellofax to incorporate as many of the advantages of MINICARD as were technically and administratively feasible. OCR management took these findings into account, along with the proportional

~~73-21/1~~

64-341/3

role that machine searches play in the overall OCR service picture, and the present limitations on staff, money, and space. These considerations led to a decision not to adopt the MINICARD System as a substitute for the Intellofax System.

So 8 years later (starting with the early investigations in 1952) after a tremendous amount of manpower and effort <sup>had been</sup> expended, <sup>give up</sup> OCR ~~rejected its long-sought goal of~~ <sup>all a asking</sup> compatibility of an information storage and retrieval system in the intelligence community. To say that the Air Force was unhappy was putting it mildly. Eastman Kodak was furious and did not agree with any of OCR's criticisms of the equipment. The company wrote a letter to the Director of Central Intelligence, whereupon the Inspector General <sup>(IG)</sup> got into the act 9 months later in questioning OCR's management of the MINICARD Project. <sup>charges</sup> The DD/I, however, in replying to the IG, was satisfied with OCR's decision and stated that "in arriving at this answer OCR took a stand which was both courageous and in the best interests of the Agency and other USIB agencies." <sup>86/</sup>

3. Revised Intellofax System (November 1960-1967)  
Approved For Release 2004/09/23 : CIA-RDP84-00951R000300040002-5

a. Systems Improvements

MINICARD was over and management devoted its energies to revitalizing and improving the Intellofax System. Viewed in retrospect, the MINICARD Project was indeed a blessing to Intellofax, for, with the big changes adopted in 1960, Intellofax survived another 7 years. Several of the recognized advantages in the MINICARD System were recommended for inclusion in the revised Intellofax System. An Intellofax Task Group, composed of representatives from MD, DD, the Library, and ADG, submitted five staff studies to their chiefs on modification of indexing requirements and techniques. <sup>88/</sup> The Task Group stressed that effort should be concentrated on the subject control of information with two specific objectives: coding uniformity, as the technique most likely to achieve a high rate of recovery from among the documents in file that satisfy <sup>ie</sup> any given questions, and greater selectivity, as the means of achieving a higher rate of relevance among the documents recovered by machine searches.

The chiefs of the three divisions and the ADG made the following recommendations, which were approved by the DAD/CR and the AD/CR on 30 August 1960, for a modified Intellofax Systems <sup>89/</sup>

1. That the four-digit numeric area notation as more economical machine-wise than the six-digit alphabetic be used with the revised ISC.
2. That a coding manual [to be prepared by the Task Group] and (the) dictionary be adopted and maintained as standard tools for document processing and retrieval.
3. That dictionary-controlled text be used.

\* Dictionary in this context was a thesaurus. (Random House Dictionary definition: "An index to information stored in a computer [or machine] consisting of a comprehensive list of subjects concerning which information may be retrieved by using proper key words.")

25X1A9A <sup>88/</sup> Memo, [redacted] to C/DD, MD, Library, and ADG, 20 May 60, sub: 25X1A9A System, C. (in Chrono June 60 - CO Job: 64-341/3) " Approved For Release 2004/09/23 : CIA-RDP84-00951R000300040002-5

Approved For Release 2004/09/23 : CIA-RDP84-00951R000300040002-5

4. That regular review of indexing input be performed on a regular basis to the extent considered necessary by the Analysis Branch.
5. That the indexing of finished intelligence be eliminated from the Intellofax System and be serviced only through reference to the IPI.
6. That a card be filed in the subject file for each area code. (Under the old system, the related or secondary area did not appear in a file position. The new area code and revamped card format permitted automatic reversal of all areas, primary or secondary.)
7. That the three divisions continue to participate in major input decisions affecting retrievability.
8. That <sup>the Machine Division T/O</sup> be increased by three, the CIA Library T/O be decreased by one which is to be transferred to the Document Division to offset the assignment of a document analysts to the Composite Group.

All the working tools for input and retrieval (see Figure 9) in the revamped Intellofax System were spelled out in detail in the Procedure Manual, which was a mutual effort of the three divisions and ADG. The three stages of input, machine support, and retrieval were considered to be of equal importance in operating the system, but the Manual emphasized the input phase as basic to the entire operation. Improvements in the rate of recovery and of relevance were dependent upon: (1) the revised ISC, which offered the advantages of a high-density hierarchical system applied with a clear set of indexing rules, and (2) the use of clear text with an open-ended dictionary, which provided flexibility. With these two tools the classifiers were able to expand<sup>a</sup> their subject control beyond the formal concepts and terms of the ISC.

It was, of course, necessary for MD to redesign the IBM card. Columns 1-6 were still reserved for the ISC subject code. A detailed description of the format of the card appears in the

Intellofax Procedure Manual of 1960. (see also Figure 9)  
Approved For Release 2004/09/23 : CIA-RDP84-00951R000300040002-5

Approved For Release 2004/09/23 : CIA-RDP84-00951R000300040002-5

Clear text inaugurated for the first time into the system included key words for particularized meaning of the subject code; abbreviated names of political parties, organizations, and conferences; and place names in conjunction with the area code. They were controlled by Dictionaries: (a) Subject/Problem Entries, known as the 2-Tag Dictionary; (b) List of Organizations, known as the 3-Tag Dictionary; and (c) Place Name Dictionaries of each Sino-Soviet country except Albania and Outer Mongolia. Usage decisions cumulated during the MINICARD test were used as a basis for the 2- and 3-Tag Dictionaries, which were updated by MD and printed by ~~Printing and Services Division~~ <sup>PSD</sup> twice a year and were the product of the document indexing effort. (MD prepared a separate IBM card for every 2- or 3-tag entry on the code sheet.)

The listing of the 2-Tag Dictionary provided the authorized ISC subject code and the clear-text entry. The print out was available both alphabetic<sup>ally</sup> by entry and numeric<sup>ally</sup> by subject code. The 3-Tag listing provided English and foreign titles, description, subject code, and clear-text abbreviation. The print out was available in two different orders: alphabetic by organization title and alphabetic by abbreviation. This Dictionary, which replaced the Annual Abbreviation File (see page 18), received wide distribution both within and outside CIA. The listings for the place name dictionaries included the place name, coordinates, ISC area code, and clear-text entry.

*Handwritten notes:*  
 PSD  
 subject  
 code sheet

\*A tag was a numeric symbol that preceded a code or clear text to indicate the kind of information controlled by that code or text. There were nine tags in all: Tag 1 was followed by a three-digit code modifier (see page 18); Tag 2 by clear text for expansion of the subject code; Tag 3-abbreviation of an organization; Tag 4-area code for reacting or commenting country; Tag 5-area code for nationality different from location of object or activity; Tag 6-area "from"; Tag 7-area "to" (related area in the old system); Tag 8-area "about"; Tag 9-place name.

75

The Task Group had determined that it was not feasible to convert the nine million IBM cards in the accumulated Intellofax files (1948-Nov 1960) to the new system. The old (known as "B") and the new (known as "A") files were separately maintained, requiring separate searches and tapes. In the words of the Task Group, these two files would be necessary "until advances in storage and retrieval techniques provide us

\_\_\_\_\_ )  
cont

\* "B" cards were <sup>filed</sup> in the Intellofax file by subject arrangement. In 1966 MD pulled and rearranged by area all the cards on China, Korea, and the Southeast Asian countries. This was to provide more expeditious servicing of heavy request traffic on those areas because of a heavy ~~traffic~~ request traffic of pre-1960 material.

21

*Re memo, C/Analyses Dir to C/MD, 3 June 1966, sub. Rearrangement of pre-1960 Intellofax Cards in Far East. U.S. Doc. 1966 66-407/2)*

with a system that does not rely on punched control data and printed bibliographic information combined in each card." <sup>2/</sup> (Possibly in 1973 a program will be completed to convert both "A" and "B" files to magnetic tape.)

The manpower requested in recommendation # 8 above was estimated on the basis of three factors: increasing the size of the subject file to accommodate equal area status (see recommendation # 6 above); establishing authoritative forms of entry for clear text (that is, the need for a Dictionary Editor in the Analysis Branch) and maintaining the Dictionaries in machine language; and maintaining and servicing two Intellofax files. Economies were achieved through reorganization of the Analysis Branch by area, use of staff previously assigned to the MINICARD project, and elimination of finished intelligence in Intellofax.

The revised Intellofax System was put into operation <sup>\*\*</sup> on 1 November 1960. The delay was due to the intensive training required for the application of the 1960 edition of the ISC combined with the new coding techniques. <sup>94/</sup> The backlog of input to the old system was eliminated by means of overtime, and by 1 January 1961 the new system was in full swing, with all classifiers fully trained.

led to the questionnaire. The selective features answered asked that nation names, and stics of Intellofax by were: (a) the and printed on ces) as the end-product ferences retrieved. ose who answered. The icipation in deciding ticularly motivated in he selectivity of index

25X1A5A1

The AD approved a recommendation from the three Division Chiefs in January 1961 that the name "Composite Group" used for Intellofax be changed since 1958 be changed to Intellofax Reference Group (IRG) to give users a more accurate idea of its activity.

In August 1961 Mr. Borel sent out a questionnaire (see Figure 11) requested by the three concerned Division Chiefs to 500 DD/I and DD/P analysts asking for their opinion of the revised Intellofax System (and to inform them what existed if they did not already know and use it). He was interested in what they thought of the new features in order to assess the effectiveness or more precise document selectivity applied to indexing

b. Impact of DARE

After the adoption of the revised ISC and the implementation of the revamped Intellofax System, the next large change affecting the system was the acceptance of DARE equipment (acronym for Document Abstract Recording Equipment produced by ). With the rejection of the ~~MINICARD~~ Project, MD turned its expertise to a proposal that was to reproduce reduced-size images of the first page of intelligence documents on IBM cards. The basic premise of the DARE proposal, as originally set forth in March 1960, was that the use of the first page of a document as a bibliographic reference would be a material improvement over the Intellofax reference (title and source only) both in substantive contact and in retrieval potential. This premise was confirmed by the CIA Librarian and the Chiefs of MD and DD on 13 March 1963.

It was anticipated that there would be an annual savings of 10 people (the typists who prepared the multilith mats for the Intellofax cards) to the tune of \$40,650 and a reduction by 2-3 days in the time lag between the document's receipt and its availability in the system. The proposal stated further that the system would provide on the Intellofax tapes immediate copies of single-page documents (35-40% of the total document input) and obviate filing single-page ~~NODEX~~ items (65% of all ~~NODEX~~ items). These expected results would reduce reproduction costs, save storage space, and reduce filing and search costs.

Two prototype machines, known as A and B, were built by

25X1A9A-29/ Memo, AD/CR to Project Review Committee, 14 March 1960, sub: Electrostatic Printing. OVO. (in Chrono Jan-May 60 64-311/1) DARE 1960-65 68-487/2

25X1A5A1

[redacted] technology. The machines were accepted and paid for in October 1962 and February 1963, respectively, at costs of \$124,913 and \$59,325. Technical problems, however, persisted well into mid-1963, although the system had been implemented for the production of ~~NODEX~~ cards in October 1962.

25X1A9A

[redacted] Special Assistant to the AD/CR, chaired a *from April 1963 to September 1965*

DARE Committee charged with monitoring and coordinating the initial tests, evaluation, and implementation of DARE. *He outlined although OCR was committed to the adoption of the DARE system, the problems as falling into five categories: concept, equipment, costs, related procedures, and implementation. <sup>still</sup> There were some people who doubted the validity of the DARE system and the appointment*

25X1A9A

of a new Librarian [redacted] in 1963) delayed acceptance of the concept. Reference librarians and document classifiers were not happy with reading the DARE card with a 3-to-1 reduction: there was no doubt about the difficulty of reading the information without magnification. (see Figure 11) The earliest and continuing concern was the perfection of the equipment and the application of rigid quality controls. In May 1963 an unsatisfactory image was still being attained on a fairly large percentage of the ~~NODEX~~ cards. By the middle of the summer the problem had been corrected, and the Library conceded that an acceptable level of image resolution was being consistently maintained.

Although the succession of technical problems experienced with the DARE machines attracted the most attention, the lack of an adequate print-out method was actually a more serious matter. *10/25/67*

25X1A5A1

80

102/ Memo, [ ] to Borel, 25 Jul 63, sub: Status of DARE Project. S. (File: DARE Folder Job: 68-487/2

1 July 1963 for the development of a printout machine that would enlarge the DARE image to approximately original document dimensions and provide a positive print by an electrostatic process. <sup>102/</sup> In the meantime, MD's Photostat Expeditor was adapted and used until the Xerox machine was available in November 1964. MD's Equipment Services Staff also developed a Viewer-Selector for magnifying and <sup>automatically</sup> selecting DARE cards.

Full realization of the potential of the DARE System required the resolution of other problems, some of which involved interagency cooperation. Problem one was the development of "meaningful" control numbers for incoming documents. (See page 58 for seven-digit common number system.) The Defense Intelligence Agency (DIA) adopted a 10-digit meaningful number <sup>\*</sup> with the Agency's establishment in January 1963. Through the efforts of a special OCR study group, <sup>102/</sup> the CIA reporting components <sup>\*\*</sup> began to assign a new 10-digit number on 1 July 1964. State remained the significant holdout as in the past, and DD <sup>control</sup> continued to assign numbers to incoming State reports. (State still does not comply as of 1973.) Problem two, also venerable, <sup>\*\*\*</sup> concerned the standardization of quality and format of documents.

\* See Intellofax Procedure Manual 1964 for complete list of 10-digit control numbers. <sup>102/</sup> (Intellofax Procedure Manuals in Intellofax Historical Files in ISG)

<sup>\*\*</sup> The effective date was set at 1 July 1964 in order to permit DD/P's large-scale machine operation, Project [ ] to revise its programs to accommodate the new 10-digit control number.

<sup>\*\*\*</sup> The history of this effort is well summarized in CODIB-D-78, which cites 37 other CODIB documents on the subject. <sup>102/</sup> (CODIB-D-78, 7 Mar 61, sub: Common Format for State Department Foreign Service Reporting and Related Problems. 25X1A2C

for bibliographic purposes depended in large measure upon the degree to which the source agencies would provide for the inclusion of certain elements, such as enclosure information and expanded titles. A DARE Committee study group on information report formats took steps within the Agency to convince OO <sup>107/</sup> to print its OO-B reports on white paper instead of the traditional pink <sup>108/</sup> it had been using. Both OO and DD/P adopted a common format.

The adoption of a USIB-wide common numbering system had accentuated doubts about need for a Source Card File in the Library. This File had been the subject of special study on a number of occasions. In November 1962 the Library proposed and the Machine and Document Divisions agreed to a 90-day test to determine the Library's need for source cards. <sup>107/</sup> After the test period a four-man Library Committee recommended that source cards be continued for all collateral documents received in OCR and be recognized as a record of common concern to all OCR Divisions involved in the Intellofax System as well as to USIB agencies. <sup>108/</sup> The three concerned Division Chiefs agreed with the Library Committee that the Source Card File was the only "author" file of intelligence reports in the community and should be retained until something better <sup>came</sup> might come along. <sup>109/</sup>

*Lead.*  
The Committee recommended that a meaningful control numbering system be devised for all document series. <sup>108/</sup>

*What are the...  
to...  
...  
...  
...*

At the request of the DARE Committee, in May 1963 a study was made to determine whether a machinable source card file of uncut IBM cards should be established and whether document retirement and destruction information could be incorporated in the source card and thus abolish the keeping of a "retirement book." The report was essentially favorable to these proposals. In September 1964, the Chairman of the DARE Committee suggested that the Library review the earlier studies and determine whether the time was opportune to make any fundamental changes in the operation of the Source Card File. The Library concluded again, and just as adamantly as a year before, that the discontinuation of the Source Card File would have a crippling effect on document services and result in additional manpower costs of 15 hours a day. The Library was, however, in favor of uncut source cards with the implementation of DARE. In the study it was stated that: "The Primary advantage the Library can expect to gain, if the use of the DARE equipment for coded documents is implemented, would be earlier delivery of source cards and simplification of search for documents in the process."

In September 1964, the three Division Chiefs recommended the implementation of DARE. The several divisional reports set forth the effects DARE would have on their procedures, efficiency, and service. The chief advantages appeared to accrue at the input with some savings in manpower and times, as well as in some simplification of procedures. The DARE machine turned out only the specific number of cards

for the Intellofax file, thus eliminating the wasteful operation resulting in the destruction of 3½ million IBM cards per year.

(PSD, which was ~~responsible~~ responsible for reproducing Intellofax cards from the multilith mats, had printed a standard number of cards, regardless of need.) The Chief MD pointed out that the addition of a new file to the ~~two~~ (already in existence) "A" and "B" Intellofax files added complications to the processing cycle. Procedures for handling damaged cards would not be as satisfactory as for the non-DARE Intellofax cards because there was not a one-to-one printing capability that could handle the reduced images. The anticipated affects of DARE upon procedures and services in the Library revolved mainly upon the use of two different formats and equipment. The Library still had some reservations about the two-track system and the negative affect it might have on the customer. Anything less than a thorough, sympathetic, and painstaking effort at the point of customer-contact could well make the difference between success and failure.

113/1  
A Quality Control Committee, consisting of one member each from the Library, MD and DD, was assigned the task of preparing and bringing together all of the procedural instructions and forms necessary for the implementation of DARE, the establishment and administration of quality controls at selected points in the system, the development of visual briefing materials, and the conduct of a dry run during the week of 26 October 1964.

*approx 2 years of extensive testing and modifications.*  
The DARE System became fully operational for both NODEXED and indexed portions of the Intellofax System on 2 November 1964, another important November date in the history of Intellofax. (November 1960 →

was the date of the inauguration of the revised ISC and the revamped Intellofax System.)

25X1A9A

Within 90 days of the full implementation, [ ] was able to report that performance exceeded expectations "both in economy and efficiency of operations and in customer acceptance." <sup>114/</sup> The lapsed time from mail bag to Aperture Card and Source Card Files was dramatically reduced from 2 or 3 weeks to 7 or 8 days or less and was being further reduced. ~~NODEX~~ items reached the file in 3 days or less. Significant savings in personnel were effected, especially in <sup>DD</sup> the ~~Document Division~~ with the dissolution of the Typing Section. (Two typists transferred to the [ ]<sup>\*</sup> experiment, <sup>25X1A2G</sup> three to MD, one to BR, and one to the IPI.) The merger of ~~NODEX~~ and index cards in the Source Card File was accomplished and this venerable file finally became mechanized because uncut (long) DARE cards were used as source cards, An Intellox requester <sup>u</sup> was provided a large green ~~covered~~ booklet of document-size prints of the DARE cards for documents indexed after 2 November and a small green booklet of cut sheets for all references to documents indexed prior to DARE. (See Figures 1A and 1B)

A review of the performance of the DARE System in September 1965 after about 10 months of operation indicated that the gains in economy and efficiency reported on in March had been maintained and improved upon. Customer acceptance of the system and satisfaction with it continued. <sup>115/</sup> The DARE Committee was dissolved. DARE continued to occupy a major role in OCR's document processing until the change to a computer-based system in 1967.

25X1A2G

\* [ ] was an OCR/Office of Computer Services (OCS) program for developing a computer-based central reference facility. It began in FY 1964

c. Equipment Developments (except DARE)

Along with the changes in input and systems design in the 1960's came improvements in the equipment used in the various facets of the system. MD continued its efforts to find technological innovations that seemed to hold promise for a better system. Some proved successful; others did not.

In 1962 MD replaced the Intellofax Tape, which had been a \_\_\_\_\_ folded tape since its inception in 1950, with a cut-sheet booklet. The requester's name and address appeared at the bottom of each citation. This was to encourage the requester to submit the citation when requesting a copy of the document and thus simplify the library search. It also expedited the tape preparation because the number of processing steps was reduced. 116/

An IBM-type 108 card selector that operated at 1,000 cards per minute and two IBM 088 collators that operated at speeds of up to 1,3000 copies per minute were installed to replace slower machines. The card input portion of the Intellofax System was programmed in 1964 for an IBM 11401 computer, and this part of the operation was performed in OCS, producing significant savings in manpower and faster input. Of particular significance was the extent to which the computer was used to generate the contents of the files and to "explode" (create) the necessary number of Intellofax, 117/ source, and aperture cards. In 1966 OCR programmers added a subject code validity check to the Intellofax computer program; this eliminated approximately one hour of work on Intellofax in EAM equipment.

Job: 68-1977

The Photostat Expeditors used for copying documents and aperture cards had been in continual operation since 1954 and had extended their maximum efficiency by 1960. The maintenance cost per unit was estimated at \$428, thus making a total of \$2,568 for the six units. MD experts had begun in 1959 to investigate replacements for these machines, which were becoming difficult to maintain. The requirements were for a machine that could handle hard copy, aperture cards, Actifilm cards, and reel microfilm. MD and PSD personnel came to the conclusion after much investigation that electrostatic printing had progressed to the point where it could truly be

25X1A5A1

considered the system of the future (speeds up to 10,000 characters per second had been demonstrated). A proposal, therefore, went forward to the Project Review Committee in March 1960 and was approved in June for a contract with [ ] for the delivery and installation of a Videograph Reproduction System, using Videograph Facsimile equipment. <sup>118/</sup> after much testing and numerous consultations, More than a year later, <sup>118/</sup> Videograph had not turned out acceptable copy from either hard copy or microfilm and the contract was therefore terminated. in November 1961. MD personnel designed and tested modifications to the Photostat Expeditors so they could continue to be used (on pre-DARE material).

Since the advent of full-scale microfilming of most documents in 1954, OCR had been using a 16mm (Mil-E) aperture card for document storage. MD discovered in the early 1960's that most other organizations in the country had changed to a 35mm (Mil-D) aperture card or microfiche. All research and development work leading to improvements in the microimage field was concentrating on 35mm. OCR management determined that it would require the expenditure of considerable CIA funds for research and development to update and make its own 16mm aperture card more efficient. Meanwhile, commercial companies were developing improved or new methods and machines for handling the 35mm aperture card. One such development that OCR, in particular MD investigated was the Filmsort 2000 camera manufactured by Minnesota Mining and Manufacturing Company (3M). This machine offered the advantage of producing automatically an aperture card for any document up to eight pages. Filmsort's one-step operation would permit OCR to speed up the processing

of the documents so that in lieu of the 3-4 day delay in getting aperture cards into the files OCR would be able to reduce that delay to one day at the most and possibly <sup>to</sup> only 3-4 hours.

OCR managers worked closely with [ ] managers in the latter's 25X1A2G DD/I plans for an improved document delivery system (DDS). Any changes in... OCR's immediate system, although not initially electronically coupled with the computer, had to have the flexibility in design that would permit such coupling in the future. [ ] recommended that OCR go to either 25X1A2G 35mm aperture card or microfiche, but microfiche was not susceptible to machine sorting and filing, whereas aperture cards were. OCR therefore opted for the latter. The DD/I approved the request for an expenditure of \$30,000 (on 7 June 1965) to purchase five Filmsort 2000 cameras and three companion Quadrant printers.

As of January 1965 the Aperture Card File and the machines that reproduced copies were organizationally under different managements within OCR-- the former was controlled by the Document Section of the Library and the latter was under the jurisdiction of MD. When an aperture card was pulled from the file for reproduction, a pink charge card was prepared and put in its place. Four courier trips a day were required to move the aperture cards from the Document Section to MD and back again. With the arrival of the Quadrant printers, small machines requiring only <sup>a</sup> few feet of space and easy to operate (in contrast to the bulky and hard to operate Photostat Expeditors), the AD/CR approved

the colocation of the files and the printers in the Document  
\*  
Section.

During 1966 technical discussions continued with 3M for improvements in the 2000 camera processor, which was not meeting density variation specifications. 3M was most anxious to satisfy CIA because many potential customers were awaiting the outcome of OCR's deliberations. During the period of 3M's work on the camera, a team of MD experts, with assistance from <sup>PSD,</sup> ~~Printing and Services Division~~ undertook further testing and countless meetings with government and commercial experts to define more precisely OCR's technical requirements. The team moved ahead with exploring the possibilities of using step and repeat cameras to backstop the 2000 operation, to provide an optimum means for capturing document images in the marginal categories, and to provide equipment more suitable for microfilming bound volumes. \*\*

25X1A9A

In June 1966, [ ] who as Executive Assistant to the AD had been charged with the problem of compatibility with [ ] 25X1A2G in the document delivery system, announced that 3 days of testing the 2000 cameras that had supposedly been upgraded by 3M revealed the same bizarre density variations from card to card and within the frame of a card experienced in previous tests. He recommended that OCR initiate procurement of modified step and repeat cameras that would lead OCR into the Mil-D-8-up format (that is, eight pages of information in a

35mm size frame). Six months later [ ] concluded that the 3M cameras were not suitable for the type of application needed and were inadequate in terms of quality control, supply costs, and manpower requirements.

The five 2000 cameras were placed elsewhere, and OCR ordered four National Cash Register ~~Model~~ Model SR-1D step and repeat 35mm cameras at a cost of \$20,946 each. They passed acceptance tests in November 1967 and were put into operation in February 1968, with the final demise of the Intellofax System, making in-house improvements as necessary. In the meantime, MD continued to use the 16mm aperture card system. Retrieval of these aperture cards is, as of 1973, still handled by the old equipment because conversion to 35mm is not feasible.

123/ Memo, [ ] to D/CR, 11 Jan 67, sub: Recommendation-Document Delivery System. S. (in Chrono 67 69-592~~4~~)

d. Usage (See also Appendix C)

Intellofax program utilization as determined from requests in FY 1966 was divided as follows among customer offices:

<u>CIA</u>		<u>Non-CIA</u>
DD/I	24.4 percent	44.8%
DD/P	20.7	
DD/S&T	7.2	
DD/S and other	2.9	
Total CIA	55.2 percent	

Requests from DoD customers totalled 1037 in 1966 and 812 in 1967. <sup>124/</sup> Requests from DoD were limited as

of March 1967 because of OCR budget cuts. All requests had to be validated through the DIA Library and coordinated with the OCR Coordinator. <sup>125/</sup> See Chapter \_\_\_\_\_ (Document Systems Group\_ for further details of service to DoD.

Support to the National Intelligence Survey (NIS) program was heavy throughout the 20 years of Intellofax operation. Standard runs were pre-coded for specific chapters of the NIS. In FY 1966 OCR received 441 NIS requests (97 CIA and 344 non-CIA) providing 156,828 references of which 103,959 were printed onto Intellofax tapes.

4. Finale

No one doubted that the Intellofax System was a high cost operation. Intellofax questions made up only four percent of the total number of search questions put to OCR. During most of the Intellofax history, 30-50 people were directly associated with the necessary indexing operations. Another 50-60 operated the IBM equipment and conducted auxiliary operations, such as microfilming and DARE, exclusively in support of Intellofax.

25X1A2G Faced with T/O and budget cuts on the one hand and the prospect of expensive [ ] on the other, the D/CR looked at the Intellofax System with a critical eye during 1964-67.

25X1A2G Should there be more in-depth indexing as [ ] was planning or should there be shallow indexing as an economy measure? Whichever way OCR went, the Intellofax System as it had been operating for 20 years was doomed. Even if greater numbers of personnel were used to provide greater indexing depth, the system with EAM equipment could not cope with the resulting flow of index information.

25X1A9A Both [ ]\* in his 1966 study of OCR <sup>126/</sup> and the 1967 User Study Group recommended shallow indexing for most information. The User Study Group indicated that users

<sup>126/</sup> [ ], 1 Dec 66, sub: Choosing the OCR File System. S. File: [ ] Folder Job: 68-487/1

93

requested in-depth indexing only for military-related  
subjects in critical areas of the world. <sup>127/</sup>

Therefore, in the CRS reorganization of September 1967, the Intellofax System gave way to a relatively inexpensive computer-assisted indexing and retrieval system through which CRS could get minimal control over that portion of the document flow that had to be controlled at all. The ISC was replaced by a greatly modified version of the 25X1C4C  subject Intelligence Code, which had been a combination of the ISC and the SR coding scheme.

In spite of the many criticisms levied against it, ranging from too many references retrieved to too few, the Intellofax System was unique. It was the only system in the intelligence community that provided machine retrieval of all information reports issued by USIB member agencies. It finally bowed to the needs of the all-source improved input and retrieval computer capability.
