TITLE: Experiments of using ultrasonic waves in selection of collective
concentrates

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Tsvetnaya metallurgiya,
no. 1, 1963, 25 - 31

TEXT: The experimental investigation was carried out for the purpose of
finding new effective means of selecting collective copper-molybdenum concen-
trates. Among others, the method of eliminating reagent coatings from surfaces
of mineral particles in ultrasonic process, were studied. The effect of ultra-
sonic waves upon selective separation of molybdenite, chalcopyrite, pyrite and
quartz was investigated with pure minerals and artificial mineral mixtures. It
was found that the breakdown of reagent coatings from the surface of mineral
particles was performed in an ultrasonic field above the threshold of cavitation
of the liquid phase. The density of the processed pulp has a substantial effect

upon subsequent flotation behavior of the mineral; the selection of the collective concentrate is improved during the ultrasonic processing of more diluted pulps with not over 10% content of solids; in denser pulps the possibility of breakdown of the reagent coatings from the surface of mineral particles is impaired. The time of ultrasonic processing of the pulp affects the results of breakdown of the reagent coatings from the mineral surfaces; 8 - 10 min is the most efficient time for processing. The breakdown of a fixed collector from the surfaces of pyrite and chalcopyrite in ultrasonic processing proceeds more fully; as a result the extraction of these minerals into a concentrate is reduced. Multi-stage processing of mineral mixtures by ultrasonic waves is not expedient, the process becomes more complex without increase in efficiency. A breakdown of xantogenate coatings without ultrasonic treatment, using merely filtration, was not observed. Filtration after ultrasonic treatment is not always necessary. There are 4 figures.

TITLE: A method of exposing a solvent to ultrasound

SOURCE: Gosudarstvennyy institut tsvetnykh metallov, Sbornik nauchnykh trudov. Moscow, no. 35, 1963, 214-218

TOPIC TAGS: ultrasonic cleaning, ultrasonic metal cleaning, ultrasonic pickling, ultrasonic metal pickling, ultrasonic degreasing

ABSTRACT: In order to increase the efficiency of ultrasonic energy transfer to a cleaning solution for aluminum wire, an existing magnetostriction converter LZh 3.838.003-D, which is used in the UZM-1,5 ultrasonic apparatus, was modified so that the ultrasound could be introduced into the solvent independently of the magnetostriction stack. To this end, the radiating surface of the stack was wrapped along the perimeter with a polyurethane plastic liner. Considerable advantages are claimed for this method, since the polyurethane introduces small damping and protects the magnetostriction radiator against the action of the solvent; on the other hand,

Card 1/2

TRANSLATION: Metals having higher cavitation and corrosion resistance were
investigated as materials for building radiators and entrances in the ultrasonic-
etching baths for transformer steel. First, the cavitation resistance in water was
determined, and then the best metals were tested in a 20% H₂SO₄ at a pressure of
5 atm, in an enclosed chamber, with an ultrasonic pressure amplitude of 8 atm.

ACC NR: AR5018643

In the latter case, the process was much intensified due to a higher speed of closing the bubbles during the compression half-cycle, which resulted in speedy destruction of the metals. Corrosion resistance of 50x70x8 radiators soldered to a magnetostriction packet was tested in a 20% H₂SO₄, at 60C, with an ultrasonic application of 7 hours a day. The results were: Ta, 16 hours; Ti, 14 hours; Mo, 52 hours. The best results were obtained with the BrAZhMTs-10-3-1,5 bronze (150 hours); this bronze has been selected for producing industrial prototypes of converters having a uniform ultrasonic field and intended for etching work in metallurgical plants.

Cathodic degreasing of iron surfaces. E. Ya. Goldstein and B. L. Agranat. Byull. Malyarnol Tekhn. 1939, No. 4, 32-6; Khim. Referat. Zhur. 1939, No. 10, 119-10. Fe plates (5 x 10 cm.) coated with petroleum and castor oil were cathodically treated in mixts. of various concns. of NaOH, NaClO, and NaHCl solns. as electrolytes. Optimum results were obtained with a soln. contg. 30 g/l. of NaOH and 30 g/l. of NaClO. The most economical c. d. was 0.5 amp./sq. dm. at a temp. of 80-90°. The time of degreasing was 2.5 min. even at low temp. (approx. 30 min. is required at 90-100° with alk. degreasing without current). In electrolytic degreasing, the electrolyte is agitated by the H₂ gas evolved. W. R. Henn

Title : Expedition of Lieutenant L. A. Zagoskin in Russian America

Periodical : Priroda, 43/9, 56-62, Sep 1954

Abstract : A book is discussed which was published by Lieutenant L. A. Zagoskin 107 years ago. In it Zagoskin describes his travels on foot in Alaska. His account covers not only the characteristics and customs of the natives, topography and climate, but also the activities of the white traders in the region. Map; illustration.

PURPOSE: The book is intended for readers interested in the Soviet Arctic.

COVERAGE: The present volume, the second of a series of three, is a collection of 27 articles by various authors presenting an historical account of the exploration and economic development of the Soviet North. A small part of the book is devoted to Arctic areas beyond the confines of the Soviet Union. The aim of the book is to contribute to an understanding of the physical geography, cartography, ethnography, and economy of the Soviet North through a historical survey of these factors. A large number of authors, explorers, scientists, travellers, pilots, navigators, etc., are cited.

TITLE: Change in the surface state of germanium during the formation of an adhesion bond with a polymer

SOURCE: Mezhvuzovskaya nauchno-tehnicheskaya konferentsiya po fizike poluprovodnikov (poverkhnostnyye i kontaktnyye yavleniya). Tomsk, 1962. Poverkhnostnyye i kontaktnyye yavleniya v poluprovodnikakh (Surface and contact phenomena in semiconductors). Tomsk, Izd-vo Tomskogo univ., 1964, 87-104

TOPIC TAGS: polymer, semiconductor research, protective coating, surface property, crystal surface, lacquer/ LVS-31 lacquer, MBK-1 lacquer

ABSTRACT: The authors study the effect which the functional groups in a polymer have on the surface state of germanium in connection with the use of organic polymer materials for protecting semiconductor devices from atmospheric action. The field effect method was used for experimentally studying the surface conductivity with the application of a constant field. The slow changes in conductivity with time were

Card 1/6

L 01286-66

ACCESSION NR: AT5020453

6

recorded. The material studied was *n*-germanium with a resistivity of 40 $\Omega \cdot \text{cm}$ and a diffusion length of 2.5 mm. The specimen was a plate with dimensions of 20 x 5 x 5 mm cut from a single crystal of germanium parallel to plane (111). Ohmic contacts were fused to the ends of the specimen. The sample was etched in a peroxide-alkali mixture. The surface conductivity is shown as a function of time in fig. 1 of the Enclosure. Typical curves for conductivity in the field effect for high resistance *n*-germanium are given in fig. 2 of the Enclosure. These curves may be given as $\Delta\sigma = f(U)$ or as $\Delta\sigma = \phi(Q)$, if Q is the induced charge of a condenser determined from the capacity. Here $\Delta\sigma$ indicates the change in surface conductivity, and U gives the potential. Polymers of the vinyl series were studied with regard to the effect of the nature of functional groups and their concentration in the chain of a copolymer on the shape of $\Delta\sigma = \phi(Q)$ curves plotted from measurements in vacuum. The results are shown in fig. 3 of the Enclosure. Curves are also given for copolymers of methyl-methacrylate with methacrylic acid, for a gelatin-germanium interface (where the gelatin has functional radicals NH₂, OH and COOH) and for polyhydroxyethylene--a polymer which has no functional polar radicals and which has oxygen bound by single bonds in the chains. A comparison of the curves indicates that functional radicals change the position of $\Delta\sigma_{\min}$ noticeably, while polymers without strongly polar groups have little effect on this parameter. Compositions of polymers were studied

Card 2/6

L 01286-66
ACCESSION NR: AT5020453

along with individual polymers. It was found that two industrial lacquers, MBK-1 and LVS-31, offer more protection against moisture than do the individual polymers. However, the lacquer films are much thicker than the individual polymer films. It is shown that LVS-31 has a few advantages over MBK-1 as a protective film for semiconductor devices. Orig. art. has: 13 figures, 6 tables.

867. (315) THE USE OF POLYGLUCIN IN TRAUMATIC SHOCK AND ACUTE BLOOD LOSS (Russian text) - Agranenko V.A. From A. A. Centr. Inst. of Haematol. and Blood Transfusion, Moscow - PROBL. GEMATOL. I PEREL. KROVI 1956, 1/2 (55-56) Illus. 2

Polyglucin has a pronounced and lasting haemodynamic effect in shock following trauma, operations and burns. Rapid injection of up to 1,000 ml. does not cause any side-effects. In traumatic or postoperative shock complicated by heavy blood loss it should be combined with blood transfusion, but the amount of blood given can be considerably reduced. References: 4.

Title : Investigation of the Spleen Intravitally by the Method of
Puncture in Chronic Myelosis and Its Clinical Significance.
Orig Pub : Za sots. zdravookhr. Uzbekistana, 1956, No 2, 30-37

Abstract : Results of investigations of 21 patients with chronic
myelosis, treated with ethyl urethane, are reported.
A close relationship of the picture of the spleen punctate
with the clinical course and the stage of the process
was established. The initial stage of myelosis is
characterized by prevalence in the splenogram of intermediate
forms of granulocytopenia; erythropoiesis is
somewhat decreased in the liver and in the bone marrow;

the number of thrombocytes is markedly increased. In all the stages of chronic myelosis accompanied with a resistant anemia the hemoglobinization of the erythro- and normoblasts (the erythroblastic reaction) is arrested; lymphopoiesis is absent or significantly reduced. During the stage of acute exacerbation of chronic myelosis, immature neutrophiles and little differentiated cells predominate in the splenogram. During the stage of severe exacerbation with a sub-acute course the number of erythro- and normoblasts decreases markedly in the bone marrow and in the spleen. With the onset of remission resulting from urethane therapy the cytogram of the spleen approaches to normal; normalization of the leukocytic formula, and an increase of the number of erythrocytes and of the hemoglobin level is also noted. The changes of the splenogram during urethane therapy

AGRANENKO, V. A.

"Study of a New Method of a Two-Stage Preparation of Preserved Blood," by V. A. Agranenko, Candidate of Medical Sciences, and L. I. Fedorova, Central Institute of Hematology and Blood Transfusion, Vrachebnoye Delo, No 8, Aug 56, pp 811-816

A method is discussed for mass preparation of preserved blood based on two steps: the preparation of preservatives in sterile appliances outside of the stations for blood transfusion, and the preparation of blood in sterile appliances containing preservatives previously sent to stations for blood transfusion and to therapeutic institutions.

Two different formulas for preservatives are given: solution TsOLIPK No 7 (acid glucose-citrate preservative with sodium sulfacyl and rivanol) and solution No 7-a (acid glucose-citrate preservative with sodium sulfacyl and chloromycetin) -- which is the preferred solution and whose advantage is explained by the substitution of the easily decomposable rivanol with chloromycetin.

A total of 117 blood transfusions applying the new two-stage method of blood prepared in TsOLIPK ampoules which were prepared up to 6 months previously proved that the therapeutic effectiveness of such transfusions does not differ from transfusions of blood that has been stored in freshly prepared preservatives. The method is simple and easy.
