Title : Mountain Afforestation Work in the Basins of Zeravshan
and Kashka-Dar'ya.

Orig Pub: Sots. s. kh. Uzbekistana, 1957, No 7, 64-65

Abstract: This article succinctly describes the principal stages in the experimentation in the mountain afforestation work on the northern spurs of the Zeravshanskiy range, starting with 1879. Successful results of the forest cultures on the terraces until 1915 are noted. The failure in the attempts to create forest planta-

tions on slopes in subsequent years (1927-1953) is emphasized. The chief agrotechnical and biological causes explaining the failure of the cultures are analyzed. The article points out the perils of growing forests by the planting-hole method on the cultivated areas, and by sections on the unterraced slopes. Attention is also called to the necessity of rigid species breeding. Agrotechnical recommendations are given. -- L.V. Nesmelov

TITLE: The kinetics of oxidation of hydrazine with nitric acid in aqueous solution

PERIODICAL: Kinetika i kataliz, v.3, no.6, 1962, 877-881

TEXT: The oxidation of hydrazine was investigated to establish its stoichiometry and kinetics. The rate of the reaction was measured by the decreasing concentration of hydrazine. Nitric acid was used in concentrations ranging from 2.2 to 8.2 mole/litre. Analysis of the oxidation products indicated that the reaction is

Since $\log [\text{N}_2\text{H}_4]$ decreases linearly with the time of oxidation, the reaction is of the first order. The reaction is however of the third order in respect of H^+ and NO_3^- ions and the experimental data are satisfactorily described by the equation

$$-\frac{d(\text{N}_2\text{H}_4)}{dt} = k_2 [\text{N}_2\text{H}_4] [\text{HNO}_3]^3 \gamma_+^3$$

Reaction of peripheral nervous system of human skin and animal skin to acetone applications. S. Agureikins. ^{HD}
Latvijas PSR Zinātņu Akad. Viži 1955, No. 4 (Volume No. 3), 127-32 (in Russian).—Nerve fibers of the peripheral nervous system of skin of humans and cats were specifically affected by acetone applications; other tissues were affected only slightly. The axons were attacked most, while the nerve ends and the epithelium nerve fibers were more resistant. The degeneration of the nerve cells spread selectively along certain fibers. No cumulative effect was observed with applications 24 hrs. apart. A. Dravnicka

TITLE: Heat transfer and resistance in a curvilinear channel with a radiation absorbing surface

SOURCE: Alma-Ata. Kazakhskiy nauchno-issledovatel'skiy institut energetiki. Problemy teploenergetiki i prikladnoy teplofiziki, no. 3, 1966, 148-152

TOPIC TAGS: radiative heat transfer, hydraulic resistance

ABSTRACT: With specific heat loads of 50,000 to 80,000 kcal/m²-hr, reliable cooling of the walls of a radiation type air heater can be achieved only if the heat transfer coefficient from the wall to the air is from 150 to 200 kcal/m²-hr-°C. It is possible to attain these high heat transfer coefficients only by increasing the flow rate substantially and, consequently, also the hydraulic resistance in the air loop. In some cases, this is not economic. The article gives the results of 100 experiments at an average wall temperature of 600-940°C. The flow rate was varied from 15 to 61 meters/sec. The temperature of the heated air

TITLE: Control of Heating Coke Ovens Along Their Height. (Regul-
irovka obogreva koksovykh pechey po vysote)

PERIODICAL: Koks i Khimiya, 1957, No.1, pp. 19 - 23 (USSR)

ABSTRACT: Factors influencing the height and dimension of flame
in heating flues and therefore directly influencing the uni-
formity of heating along the height of ovens were investigated.
These factors are: a) the velocity of gas flow at the entr-
ance to heating flues; b) coefficient of air excess, and
c) calorific value of gas used for heating. When investigating
one of the above factors the remaining factors were kept con-
stant. The uniformity of heating along the height of ovens was
determined by measuring temperatures in the tar line at three
levels (0.6, 2.1 and 3 m from the oven sole), temperatures of
bottom, top and along the height of heating flues. The latter
was done by measuring the temperature of a nickel plate immersed
to various depths in the flue. From final temperatures in the
tar line the weighted mean coke temperatures were calculated
by planimetering respective diagrams. Ovens of the type ПК-42
and ПК-49 on the Magnitogorsk Combine (Magnitogorskiy Kombinat)
were the object of investigation. The influence of the gas-air
stream velocity at the entrance to heating flues was studied on
Card 1/3 ovens of the ПК-49 type, fired with blast furnace gas with 3%

Control of Heating Coke Ovens Along Their Height.

68-1-6/21

of coke oven gas. The amount of gas and air supplied for heating was kept constant and their velocity controlled by bottom dumpers. The results obtained indicated a considerable increase in the temperature of the upper part of heating flues with increasing velocity of the air-gas stream (Figs. 1 and 2). The influence of the coefficient of air excess on the uniformity of heating was investigated on ПК-49 (on a sector of 10 ovens) and ПК-42 ovens (on the whole battery). The following air excess coefficients were tested: 1.1, 1.2 and 1.3. With the variation in the excess air, the velocity of gas stream and the length of the flame vary, so that changes in the temperature distribution are the results of the above three factors. It was found that with increasing excess of air, the length of the flame decreases; moreover, the influence of this factor is more pronounced on ПК-49 ovens than on ПК-42 ovens. With increasing excess of air the temperature of the top part of coke and heating flue decreases and the temperature of the bottom part increases (Tables 1 and 2). The influence of calorific value of gas on uniformity of heating was carried out by varying the percentage of coke oven gas added to blast furnace gas from 1.5 to 11.5%. Changes in the calorific value of the heating gas also affect two other factors previously discussed. Experiments indicated that on Card 2/3 increasing the calorific value of the heating gas (at a constant

Control of Heating Coke Ovens Along Their Height.

68-1-6/21

consumption of heat) the temperature of the lower zones of heating flues increases (Fig. 3). A large number of experimental results obtained during the investigation permitted the deriving of statistical relationship between the temperature of control heating flues and the temperature of the coke (Fig.4). In the temperature range: 1 300 to 1 340 °C on the pusher side and 1 340 to 1 380 °C on the coke side, the relationship is linear. An increase of temperature of a control heating flue by 10 °C increases the mean temperature in the tar line by 36 °C on the pusher side and by 32 °C on the coke side. It is pointed out that increase in temperature is non-uniform; the temperature of the bottom part of the coke increases most.

On the effect of extracts from ...

Proc. Nat. Acad. Sci., 40, 881, 1954) and were then suspended in an 0.25 M saccharose solution with 0.0018 M CaCl₂. After incubation at 2000 for 3 hours, the suspension was centrifuged, and the nuclei finally extracted. The resulting alkali extract was used to determine radioactivity and the quantity of DNA according to the method of Burton (Ref. 10: Biochem. J., 62, 315, 1956). Preliminary experiments showed that when the boiled nuclear suspension was incubated with Na₂HP₃₂O₄ radioactive P was not included in the fraction studied, indicating that the alkali hydrolyzate was completely free with extract from irradiated plants were less likely to incorporate P³² than was the case with non-irradiated, the average difference being 40 %. Extracts from irradiated plants as compared with non-irradiated, therefore, gave greater inhibition of the phosphorylation processes. There are 1 table and 10 references: 8 Soviet-bloc and 2 non-Soviet-bloc. The references to the English-language publications read as follows: V.G. Allfrey, Proc. Nat. Acad. Sci., 40, 881, 1954; K. TITLE: Double scattering of pions by nucleons at low energies

CITED SOURCE: Uch. zap. Kabardino-Balkarsk. un-t, vyp. 16, 1962, 206-209

TOPIC TAGS: pion, nucleon, scattering, double scattering, low energy

TRANSLATION: The probability of formation of an additional pion in a collision between a neutral pion and a nucleon (double pion scattering) is calculated, under the assumption that the pion-nucleon interaction has a nonlinear character, on the basis of the general formula derived by the author previously (RZhFiz, 1960, no. 9, 22188) for multiple pion production. The total cross section for the production of the scalar meson is calculated in the low-energy approximation. The results of the calculation are compared with experiment for double scattering of pions by hydrogen. V. Astaf'yev.

AUTHORS: Agyribichanu, I. I.; Popesku, I. M.; Kukurezyanu, I.; B
Vasiliu, V.TITLE: Magnetic resonance of the level 7^3S_1 of Hg^ISOURCE: Optika i spektroskopiya, v. 17, no. 4, 1964, 475-482TOPIC TAGS: magnetic resonance, mercury, energy level, magneto-
mechanical ratio, polarization, resonance line shapeABSTRACT: The method used in the investigation is the double radio-optical resonance method proposed by Brossel and Kastler (Compt. rend. v. 229, 1213, 1949). The experimental set-up is similar to that previously described by Brossel and Julienne (Compt. rend. v. 242, 2127, 1956). The magneto-mechanical ratio and the level lifetime of magnetic resonance of the 7^3S_1 Hg^I level were determined by investigating the degree of polarization of the 4358 and 4047 Å lines.

Card 1/3

L 12904-55
ACCESSION NR: AP4047169

with an alternating magnetic field of resonant frequency applied to the system. The resonance lines obtained by measuring the degree of polarization of the 4358 Å line at a nitrogen pressure 6 mm Hg have a Lorentzian shape, in agreement with the theoretical data of Brossel (Ann. de physique v. 7, 622, 1952). A variation of the mercury vapor pressure from 2×10^{-4} to 1.7×10^{-3} mm Hg does not lead to a change in the half-width and the shape of the resonance line. A change in nitrogen pressure from 6 to 22 mm Hg broadens the resonance line and changes its shape, making registration of the resonance possible only at the higher frequency of the radio frequency field. The degree of polarization of the 4047 Å line change less during resonance than the degree of polarization of the 4358 Å radiation. The average lifetime determined in this manner agrees with the value obtained by another exact method (E. Brauner et al., Nature, v. 175, 830, 1955; Bull. Am. Phys. Soc. v. 30, 32, 1955). The experimentally obtained Lande factor also agrees with the calculated theoretical value. An important result is the clarification

Card 2/3

L 12904-65
ACCESSION NR: AP4047169

of the effective collisions between the nitrogen molecules and the excited atoms of the 7^3S_1 Hg^I on the average lifetime of this level. Resonance in this state was observed for the first time by measuring the degree of polarization of the 4047 Å line. Orig. art. has: 4 figures and 2 formulas.

AUTHOR: Agzamov, A.

TITLE: Diurnal variation of temperature over Tashkent

CITED SOURCE: Nauchn. tr. Tashkentsk. un-t, vy* p. 225, 1963, 3-14

TOPIC TAGS: meteorology, air temperature, atmospheric surface layer

TRANSLATION: On the basis of an analysis of diurnal temperature variations in the free atmosphere over Tashkent, using data from several series of frequent soundings in 1954, 1955 and 1958, the author concludes as follows. When radiation corrections are taken into account it is possible to obtain quite reliable data concerning the diurnal variation of temperature. There is no monotonic increase in the amplitude of the diurnal variation of temperature with height in the range of heights 2-3 to 36 km. Changes of the mean daily amplitude of air temperature conform to definite patterns. The amplitude is maximum at the earth's surface. At a height of 1.5 km it decreases sharply and becomes smaller

Card 1/2

ACCESSION NR: AR4036336

by a factor of 4-5 than at the surface. Between 1.5 and 5.5 km there is a smoother decrease of amplitude. Beginning at 5.5 km the changes of amplitude change sign and in the layer between 5.5 and 9.0 km its values increase considerably. At a height of 9 km the maximum is approximately twice as great as the minimum of 5.5 km. Farther aloft the temperature amplitude again decreases. During a 24-hour period there sometimes are double temperature maxima and minima which have no definite time variation. Beginning at a height of 3 km the radiation correction appreciably decreases the mean daily amplitude. Bibliography of 14 titles. N. Rudometkina.

TITLE: Visual-optical observation station for man-made earth satellites

SOURCE: Tashkent. Universtitet. Nauchnyye trudy, no. 259. Fizicheskiye nauki, no. 23, 1964. Fizika atmosfery i aviatsionnaya meteorologiya (Physics of the atmosphere and aviation meteorology), 11-13

TOPIC TAGS: artificial earth satellite, artificial satellite observation, satellite tracking, ~~satellite reconnaissance equipment~~, ~~observation tubes~~, space-craft observation station, tracking equipment

ABSTRACT: Developments and activities of the observation station for man-made earth satellites are reviewed from the time of its setup in the summer of 1957 through 1964. The station is located on Chigotay hill within 2 km of Tashkent and consists of the observation platform and the station itself. It is serviced by students and the faculty of the Physics Department, Tashkent State University, and is headed by A. Agzamov. General guidance and consultation are given by Professor V. A. Dzhordzhio. The observation platform is outfitted with a telescoping roof with permanently installed TZK tubes for visual observation. The station, at the present time, receives up to 12 in-transit messages daily from the satellite

TITLE: AT₃₀₀ prognosis over central Asia

SOURCE: Tashkent. Universitet. Nauchnyye trudy, no. 259. Fizicheskiye nauki, no. 23, 1964. Fizika atmosfery i aviationskaya meteorologiya (Physics of the atmosphere and aviation meteorology), 114-118

TOPIC TAGS: atmospheric geopotential, atmospheric model, topography

ABSTRACT: Possibilities of prognosis by investigating the correlations between the daily changes of geopotential on AT₅₀₀ and AT₃₀₀ over Central Asia are being discussed. The area studied was located between 35-50° of northern latitude and 45-80° of eastern longitude. Charts of baric topography for April 1955, October 1956, and November 1963 (obtained from the Tashkent Weather Bureau) served as a source of information. From the known AT₅₀₀ charts, AT₃₀₀ charts were calculated for the preceding 24 hours. Comparison of calculated data with actual values of F₃₀₀ geo-potential has shown that the absolute difference between these values is insignif-

25
