Title : On Chemical and Bacteriological Indices in Sanitary
Inspection of Meat

Orig Pub : Rev. igiena, mecrobiol. si epidemiol., 1955, No 3, 78-87

Abstract : In conjunction with organoleptic determinations a study was made of some chemical and bacteriological indices of 100 samples of sound and tainted beef. It was found that values of pH, H₂S, PH₃ and amine nitrogen do not characterize individually the meat quality; Nessler's reaction ($\text{NH}_3 < 20 \text{ mg\%}$ and precipitation of globulins (Korezhnov's and corrosive sublimate methode) and also bacteriological investigation of the meat can serve as quality indices of meat. Considered is the correspondence of organoleptic, and chemico-bacteriological results of determinations.

"Study of the Immunological Properties of Anti-Prolactin Serum Formed Upon Simple Prolactin Treatment"

Budapest, Kisérletos Orvostudomány, Vol 18, No 6, 1966; pp 640-644.

Abstract: After injection of purified sheep prolactin preparation without adjuvant anti-prolactin (Pr) antibodies appeared in the blood of experimental rats, which showed a precipitation reaction with Pr on an agar gel plate, and which agglutinated sheep erythrocytes sensitized to Pr in a high titer. The antibodies may be detected in the gamma globulin of the immune serum by means of immunoelectrophoresis. On the basis of authors' studies the sheep-Pr and anti-Pr are considered species-specific from the immunological point of view. The antisheep Pr serum reacted only with extracts of sheep and bovine hypophysis, and showed no reaction with aqueous extracts of human, dog, rabbit, rat, guinea pig and pigeon hypophysis. On the basis of these results it is believed that Pr may be quantitatively determined by an immunological method, but to do this it is absolutely necessary to take into consideration the species-specific property of Pr. 28 References, mainly Western. Title : Comparative Evaluation of Determination Methods of Fat Content in Milk.

Orig Pub: Tehnika, 1957, 12, No 10, Prehranbena ind., !!
No 10, 156 - 158.

Abstract: The fat content in milk was determined parallelly by the methods of Herber, Inikhov and D'yakov. The acidobutyrometric method of Herber was found to be the most rapid and the most accurate; the determination by the method of Inikhov are the simplest, safe and cheap, but they take the most time.

Warsaw, Polski Tygodnik Lekarski, Vol 18, No 22, 27 May 63,
pp 769-772.

Abstract: [Authors' English summary modified] Authors report their findings on administration of the acetylcholine provocation test to patients with bronchial asthma, bronchospasm, and chronic bronchitis. Strength of the test was evaluated by the so-called bronchial spasm index, which is the total percentage change in the lung vital capacity, forced expiration volume, and minute volume before and after test. Bronchospasm should be suspected with an index of 25-60, and definitely diagnosed above 70, with an index of 70-119 indicating the mild, 120-180 moderate, and above 180 severe form. The 23 refs comprise 3 Polish, and about 5 in German, the others being Western.

The history of electrically operated impact tools built in other countries is dealt with as well as the encouraging results obtained with the Hungarian made *Wagner* hammer, the main feature of which is two eccentric weights rotating in inverse senses. Details are given on a hammer designed by the author which weighs 10.5 kg; in this hammer the torque is transformed into a 555 cpm oscillation through a bevel gear and a crosshead, the drive acts against a helical spring. The prototype is characterized by high efficiency and economical operation. P. Mazzolini

Candidate of Physics and Mathematics; Ya. Kh. Turakulov, Doctor of Biological Sciences. Ed.: R. I. Khamidov; Tech. Ed.: A. G. Babakhanova.

PURPOSE : The publication is intended for scientific workers and specialists employed in enterprises where radioactive isotopes and nuclear radiation are used for research in chemical, geological, and technological fields.

COVERAGE: This collection of 133 articles represents the second volume of the Transactions of the Tashkent Conference on the Peaceful Uses of Atomic Energy. The individual articles deal with a wide range of problems in the field of nuclear radiation, including: production and chemical analysis of radioactive isotopes; investigation of the kinetics of chemical reactions by means of isotopes; application of spectral analysis for the manufacturing of radioactive preparations; radioactive methods for determining the content of elements in the rocks; and an analysis of methods for obtaining pure substances. Certain

V *Fructus foeniculi macedonici.* B. Akacic and A. Rogina:
Acta Pharm. Jugoslav. 3, 62-9 (1953).—Anatomic-morpho-
logical and some chem. properties of *Foeniculum macedoni-*
cum and *Fructus foeniculi macedonici* are described. The
plant contains 2.6% of volatile oil, 0.5-8.2% of ash, and
11.9-13.2% of moisture. The volatile oil has the follow-
ing characteristics: d_{4}^{20} 0.9765-0.9774, $[\alpha]_{D}^{20}$ +6.6 to +8.8°,
 n_{D}^{20} 1.5467 — 1.5478, m.p. 9.8—10.5°. One part of oil is
sol. in 0.7 part of 90% EtOH. The oil gave on fractiona-
tion a fraction of 60% pure anethole. V. Mihajlov

(2)

Histochemistry of volatile oils in vegetable drugs. B.
Akadić, and B. Poje. *Acta Pharm. Jugoslav.* 3, 162-71
(1953) (English summary).—The detection of essential oils
by Mesnard's method gave neg. results, whereas Kofer's
app. (C.A. 29, 21) was successfully applied to the detn. of
essential oils in drugs. The method developed consisted of
heating the materials contg. oil on a small glass plate cov-
ered with a watch glass. The oils volatilized and condensed
on the inside of the watch glass and were then treated with
ZnICI reagent, which produced a colored product. All
drugs mentioned in Pharmacopæia Jug. II were tested and
convenient temp. ranges reported. The method is appli-
cable to volatile materials only. 19 references. V. M.

AKACIC, Branka

Volatile oil of thyme as anthelmintic. Branka Akusic and Jovan Petrikic (Inst. Pharmacognosy, Zagreb). *Acta Pharm. Jugoslav.* 5, 183-8 (1955) (English summary).—The essential oils (I) of *Thymus vulgaris* were distd. off by steam in a glass app. The amt. of oil, collected in 2 consecutive years, was 1.7 and 1.0% d; 0.8950 and 0.8940, $[\alpha]_D^{25} -1.0$ and -1.4° , $n_D^{20} 1.4919$ and 1.4915, phenol content, by the Boga and Meinhard photometric method (*C.A.* 49, 16350g) 27 and 22%. The standard soln. in this detn. was 0.67-2 mg. % in 2% NaOH, measured at 470 m μ . The anthelmintic properties of I were studied on ascarides, leeches, and mice. Thymol had the strongest lethal effect, followed by I, and the nonphenolic part of I, which showed low toxicity, especially on ascarides. I were very toxic to mice, and much less to ascarides. It is suggested that I be used as anthelmintic. T. Jurcic
