TITLE: An Apparatus for Testing in Nature the Resistance of Boring Tubes for Geological Prospecting (Ustanovka dlya naturnykh ispytaniy na vynoslivost' buril'nykh geologorazvedochnykh trub)

PERIODICAL: Zavodskaya Laboratoriya, 1958, Vol 24, Nr 10, pp 1261-1263 (USSR)

ABSTRACT: An apparatus was constructed which makes possible the testing mentioned in the title of tubes with a diameter of 60 mm. In projecting the apparatus the construction of the stand for tests on location of the resistance of prospecting tubes was used. (Ref 1). The load method was employed, in which the bending moment is reached by the centrifugal force of a weight rotating around the sample at rest. The main technical data on the apparatus are given with a schematic representation and a description. Natural compounds of geological prospecting tubes (diameter 60 mm) with joints welded-on were tested by the apparatus described. The experiments carried out showed that the apparatus may be recommended for tests as well as for the elaboration of new tube constructions and the corresponding classification of their resistance to fatigue. There are 2 figures, 1 table, and 1 reference, which is Soviet.

TITLE: Determination of cyclic toughness of metals

PERIODICAL: Zavodskaya laboratoriya, v. 27, no. 2, 1961, 194-197

TEXT: A new method for the determination of cyclic toughness of metals was elaborated at the author's institute on the basis of the known energetic method (Ref. 1). The standard sample (ГОСТ (GOST) 2860-45) is submitted to a continuously increasing load up to failure under pure circular bending, the power needed for twisting the sample being recorded by a recording wattmeter. Fatigue testing machines of the types HY (NU) and MYM-6000 (MUI-6000) were modernized for conducting these tests. The kinetic diagram of the MYM-6000 (MUI-6000) machine is shown in Fig. 1 (1 = jointed binary expansion link box, 2 = movable weight, 3 = leveling mechanism, 4 = Hg breaker). The machine consists of three principal parts: a = machine, b = unit for automatic continuous loading, c = unit for automatic synchronization of the loading lever. A pointer wattmeter of the type DMB (DMV) is connected to the machine for controlling the recording wattmeter.

Card 1/3

Determination of cyclic ...

S/032/61/027/002/015/026
B134/B206

Tests were conducted with bar steel of the grades 40Y (40U) (0.45% C, 0.64% Mn, 0.26% Si, 0.020% P, and 0.023% S) and 20XH (20KhN) with and without cooling of the samples, and it was established that the values of cyclic strength and toughness were somewhat raised by cooling. Further tests were, therefore, made under cooling and at 12-14°C. Bar samples of 20KhN steel of various shapes (with and without head) and diameters of 10 and 7.5 mm were tested on the NU machine. The breaking point of smooth samples was somewhat lower than that of samples with head. The power curve was plotted within the ordinates stress and number of loading cycles versus power applied to twisting the sample. The metal resistance to cyclic plastic deformation can be well determined from the diagram obtained, the cyclic toughness being graphically. At equal breaking points, the metal having the higher cyclic-toughness value is the better one. There are 2 figures, 2 tables, and 1 Soviet-bloc reference.

AUTHOR: Kerimzade, A. S.; Akhmedov, B. M.

TITLE: A new method for the determination of the limited wear resistance of metals

SOURCE: Prochnost' metallov pri peremennykh nagruzkakh; materialy* tret'ego soveshchaniya po ustalosti metallov, 1962 g. Moscow, Izd-vo AN SSSR, 1963, 165-169

TOPIC TAGS: wear resistance, limited wear resistance, durability, metal durability, machine part lifetime, plastic deformation, overload

ABSTRACT: A new method for determining the lifetime of moving metal machine components is proposed. The method described can be used to predict expected lifetime at any overloading of the components, using a standard sample specimen. The basis for the calculation is provided by the diagram representing the functional relationship between the power W necessary to revolve the component through a single revolution, and the time t of operation of the cyclic loading on the component. The following relationship is assumed: $W = at^2$, where a is an absolute constant. The area under this curve characterizes the work of repeated plastic deformation. It was found that there exists a real degree of overloading, characterized by the ratio σ_{max}/σ_w where σ_w = the

ACCESSION NR: AT4014048

strength of the metal and σ_{max} = the limit of its cyclic strength. If the cyclic yield of the metal is attained, then after removing the overloading the power versus time curve becomes a N horizontal straight line. Removing the load does not affect the work done by repeating the plastic deformation. This work can be done by the plastic deformation expressed by:

$$S = Wt_m = \frac{\sigma_{max}^3}{3}, \quad (1)$$

and the lifetime of the component by:

$$N = nt_m = \frac{ant_m^3}{3W} \quad (2)$$

$$N = \frac{n(\sigma_{max} - \sigma_w)^3}{3K\sigma_w^3(m-1)^2} \quad (3)$$

where s = the work done by the second plastic deformation,

t_m = time of overloading,

n = number of revolutions per minute,

m = the coefficient of overloading and

K = the rate of the load increase.

TITLE: Mechanical properties of polyformaldehyde

SOURCE: Plasticheskiye massy, no. 10, 1965, 28-30

TOPIC TAGS: polyformaldehyde plastic, mechanical stress, solid mechanical property, elongation, creep, tensile stress, mathematic analysis

ABSTRACT: The mechanical properties of polyformaldehyde were studied and equations describing them were developed. Polyformaldehyde samples prepared at the VNIIPTKhimmash were cast at 1200 kg/sq cm at 190-195 C, held for 5 sec, and cooled for 5 sec. Mechanical properties, creep, and relaxation were studied. The mechanical characteristics (elongation, modulus of elasticity and yield point) of polyformaldehyde are dependent on the rate of deformation. This relationship was found previously to be characteristic for other polymeric materials. Under uniaxial stress and normal temperature under stresses below half

Card 1/2

L 21999-66

ACCESSION NR: AP5024503

the tensile strength, polyformaldehyde has the properties of a linear viscoelastic medium which can be described by the linear Boltzmann-Volterra equation. At stresses greater than half the ultimate strength, the nonlinear equation of Yu. N. Rabotinov applies. "The authors thank V. I. Shobolov for participation in the experimental work." REF SOURCE: Sb. Geol. rezul'taty prikl. geofiz. Geofiz. issled. stroyeniya zemn. kory. M., Nedra, 1965, 155-167

TOPIC TAGS: geologic survey, geologic exploration, geophysic data

ABSTRACT: The basic geotectonic zones are defined using gravimetric data; the thickness of the crust and the depth at which the "basalt" layer is embedded are calculated. The thickness of sedimentary rocks is established in depression zones to which all the principal gas and petroleum bearing regions are related. Seismic surveys, together with the results of gravimetric, electrical, and magnetic prospecting, have made it possible to establish the plutonic structure of Mesocenozoic deposits and to show a great number of buried anticlinal folds in the petroleum bearing regions. A similarity in the gravimetric picture of the Western and Eastern Caucasus leads one to believe that their plutonic structures are analogous. [Translation of abstract]

TITLE: Deep-seated structure of Azerbaijan in the light of geological and geo-physical data

SOURCE: International Geological Congress. 22d, New Delhi, 1964. Geologicheskiye rezul'taty prikladnoy geofiziki (Geological results of applied geophysics); doklady sovetskikh geologov, problema 2. Moscow, Izd-vo Nedra, 1965, 155-167

TOPIC TAGS: *GEOPHYSIC EXPEDITION,* tectonics, earth crust, meganticlinoria, ~~_____~~, gravimetry, basalt/Azerbaijan

ABSTRACT: The principal geotectonic elements of the upper and the lower layers of the Earth's crust in Azerbaijan are associated with the structure of the Caucasian meganticlinoria and the intermontane Kura depression. Meso-Cenozoic deposits of varying lithofacies, up to 16-km thick in foredeeps, form part of these elements. Submontane and mountainous parts are mainly composed of Mesozoic formations, while depressions are made of Upper Tertiary and Quaternary deposits up to 6-7-km thick. Owing to the absence of outcrops, the knowledge of the crystalline basement is rather limited, and the study of its structure is based on the data of geophysical prospecting—gravity surveying and deep seismic-refraction shooting. Geophysical

TITLE: Polymerization of butadiene with styrene in an emulsion using the oxidation-reduction system hydroperoxide-iron-trilon complex-hydroquinone-sodium sulfite

PERIODICAL: Kauchuk i rezina, no. 3, 1963, 1 - 5

TEXT: A study was conducted on the possibility of using sodium sulfite as one of the components in an oxidation-reduction system. A new variation of the iron-trilon system was developed using sodium sulfite. The role played by the activators of this system was investigated. The experiments were carried out on 93 - 94% butadiene rectificate and 99.5% styrene. Potassium soap of disproportionated colophony was used as emulsifier. The effects of the main factors on the rate of polymerization under the influence of the system hydroperoxide-iron-trilon complex-hydroquinone-sodium sulfite were studied. Experiments showed that the hydroquinone in the investigated system may be replaced by benzoquinone with the same polymerizing effect. The mechanism of the polymerization

Card 1/2

Polymerization of butadiene with...

system studied is divided into three stages: 1) reduction of the trilon complex of the tri-valent iron by the hydroquinone, 2) oxidation of the trilon complex of the bi-valent iron forming free radicals of hydroperoxide, in turn causing the polymerization reaction, 3) reduction of the benzoquinone by the sodium sulfite. It is concluded that the newly developed oxidation-reduction system, using iron-trilon complex, hydroquinone and sodium sulfite as activators, can be used in an emulsion at 5°C, yielding a high polymerization rate. The system can be used in the production of synthetic rubber. There are 6 figures.

AUTHORS: Akhmedov, G. G.; Radchenko, I. I.; Korchmarek, V. V.

TITLE: Oxidation-reduction system of polymerization. Hydroperoxide-iron-Trilon complex-hydroquinone-sodium sulfite

SOURCE: Kauchuk i rezina, no. 2, 1964, 5-9

TOPIC TAGS: polymerization, rubber polymerization, butadiene styrene polymerization, oxidation reduction system, di-isopropylbenzene hydroperoxides, iron Trilon complex, hydroquinone, sodium sulfite, sodium hydrosulfite, sodium hyposulfite, sodium monosulfide

ABSTRACT: This is a continuation of a previous article by the authors (Kauchuk i rezina, No. 3, 1, 1963). The present investigation also includes sodium hydrosulfite and sodium monosulfide. The polymerization was conducted on an emulsion of a mixture consisting, by weight, of 70 parts butadiene and 30 parts styrene at a temperature of 5C, using 5.8 parts of potassium rosinate as emulsifier and 0.15 parts of di-isopropylbenzene monohydroperoxide as initiator. To the mixture were added 200 parts of water, 1.36 parts of potassium chloride as an electrolyte, and

Card 1/17

ACCESSION NR.: APL017160

0.3 parts Leukanol as a dispersing agent. It was found that at a concentration of 0.60×10^{-3} moles sodium sulfite and 0.1×10^{-3} moles hydroquinone the extent of polymerization reached 60%. A double amount of hydroquinone and 0.65×10^{-3} moles of sodium sulfite raised it to 80%, but no polymerization occurred in the absence of hydroquinone. Sodium hyposulfite was only half as effective as sodium sulfite, and here also the presence of hydroquinone was essential for polymerization. On the other hand, neither sodium sulfide nor sodium hydrosulfite required hydroquinone in their performance, sodium hydrosulfite being the most effective of the series. The effectiveness of the iron-Trilon complex as compared to the iron- α -phenylnitroline and iron-alpha, alpha'-dipiridyl complexes in the polymerization of the butadiene-styrene emulsion was studied in the presence of hydroquinone and sodium sulfite. The iron-Trilon complex emerged as the most active. Orig. art. has: 5 charts and 2 formulas.

ORIG. PUB.	:	Tr. Tashkentstik. s.-kh. in-t, 1957. vyp. 8, 7-11
ABSTRACT	:	The technique and results of experiments carried out in 1953-1955 at Department of Industrial Crops at Tashkent Agricultural Institute are set forth. Early disbudding and early breaking-off of the monopodiae has a positive effect on the development of the cotton plant and produces an increase in the yield of cotton wool of 1.5-2.5 centners/ha. Late breaking-off and partial pruning of monopodial branches do not produce any substantial effect on the change in the development of the plant and on the increase in the yield.
