AUTHOR: Aristov, N. P.; Gellar, Yu. A.

TITLE: Properties of <sup>4455</sup>tool steels <sup>4415</sup>used as machine steels

SOURCE: Metallovedeniye i termicheskaya obrabotka metallov, no. 9, 1965, 18-21

TOPIC TAGS: tool steel, induction hardening, case hardening, machine steel, metal heat treatment, grain structure

ABSTRACT: The introduction of new methods of surface hardening, particularly those based on induction heating with high-frequency currents, has made it possible in many cases to dispense with the labor-consuming process of case-hardening and to further mechanize and automate the heat treatment of metals. Furthermore, it is expedient to use tool steels for the fabrication of certain machine elements for which a highly wear-resistant surface is required. In this connection the authors describe comparative investigations of the principal mechanical properties of tool steels and case-hardened steels with the object of selecting a high-carbon tool steel whose properties best correspond to the properties

12

of case-hardened steels. Rod specimens (diameter 18-25 mm, length > 3 mm) of these steels were subjected to a microstructural examination and to different regimes of heat treatment, and, subsequently, subjected to mechanical tests. Findings: in case-hardened steels the structure was that of small grains of ferrite along with a small amount of finely laminar pearlite while in tool steels the structure was in most cases that of granular pearlite with a small number of structurally free carbides; normalization prior to quenching is the optimal regime of heat treatment for case-hardened steels, while for tool steels high-temperature tempering at 650°C is recommended. Following the heat treatment of both types of steels, the two most important mechanical properties: yield point and impact toughness, are much higher for tool steels than for case-hardened steels. Hence the use of tool steels hardened by induction heating in place of case-hardened steels is warranted, especially in cases where the case-hardened steels are of the carbon, chromium, and manganese-chrome types (15<sup>2</sup>, 20<sup>2</sup>, 15Kh<sup>2</sup>, 20Kh<sup>2</sup>, 18KhGT<sup>2</sup>). Of the tool steels, U7<sup>2</sup>, 85KhF<sup>2</sup>, Kh<sup>2</sup>, and Kh06 display the optimal properties. Orig. art. has: 1 figure, 2 tables. 27

**AUTHORS:** Megliverky, Ye.M., Candidate of Technical Sciences, Finger, O.G.

**TITLE:** Scientific-Technical Conferences and a Seminar on the Production and Processing of Chemical Fibers

**PERIODICALS:** Khimicheskaya nauka i promyshlennost', 1959, Vol. 4, Nr. 3, pp. 358-401 (USSR)

**ABSTRACT:** In November-December 1958 the All-Union Scientific-Technical Conference on Problems of the Application of Chemical Fibers in the Textile, Knit Goods and Haberdashery Industry took place with the participation of the VNO Izmeli Mendel'evy (All-Union Chemical Society Izmeli Mendel'evy). It was attended by 250 representatives of plants and scientific research institutes and scientists from China, Hungary, Poland and Czechoslovakia. The deputy of the president of the GOSK of the USSR M.A. Petrov pointed out that rational processing methods are necessary. A list of 100 (Operativnye) main questions which need to be solved in the USSR is given. The USSR Council of Ministers presented a paper on the state and development of the production of chemical fibers in the USSR; Professor Z.A. Rogovin (Moskovskiy Tekstilnyy Institut - Moscow Textile Institute) on technical methods of increasing the production of chemical fibers; Professor A.B. Pukhaber (VNIIV) on modern methods of studying the properties of chemical fibers; Candidate of Technical Sciences J.I. Fil'chevskiy (GNTK USSR) on "The Production of Improved Materials from Artificial and Synthetic Fibers"; Professor V.Ye. Zhur (Moskovskiy Tekstilnyy Institut - Moscow Textile Institute) on the basic principles of mixing natural fibers, especially wool, with chemical ones; Fiber Professor I.A. Burzina (Moskovskiy Tekstilnyy Institut) on the effect of the humidity of wool on its mechanical properties; A.M. Gol'd (On the experience of processing staple fibers in his plant; M.A. Orlov (VNIITekstma), P.I. Aristou (VNIITK), Doctor of Technical Sciences (VNIITekstma), A.M. Vashurin) on the problems of designing and introducing new types of technological equipment. The Conference noted the backwardness in the development of efficient spinning, weaving and finishing equipment, the insufficient coordination of work and the lack of necessary laboratory equipment. On December 13-17, 1958, the All-Union Conference of Workers of the Industry of Chemical Fibers took place.

TITLE: Experimental regional seismic observations in the western part of the North Caspian petroliferous basin

SOURCE: Ref. zh. Geofiz, Abs. 3D150

REF SOURCE: Tr. Nizhne-Volzhsk. n.-i. in-t geol. i geofiz., vyp. 2, 1964, 170-178

TOPIC TAGS: seismic prospecting, geologic exploration

TRANSLATION: The paper describes the results of a field work in an area where the Voronezh massif of the Russian Platform adjoins the Caspian Basin. Two seismic profiles were run, totalling 140 to 150 km. The KMPV method was mostly used, although some work was done by the MOV and even RNP methods. The profiling was continuous when using the KMPV method. The wave reflected from the basement top was traced through the entire lengths of the profiles, since this basement was the main object of investigation. It was recorded as first "kicks" at distances of 9 to 35 km from the primary wave. Its apparent velocity varied between 5800 and 6300 m/sec. Its coefficient of dampening was  $1.7 \cdot 10^{-5}$  1/M. The superimposing traces lacked a parallelism. This wave was identical with the refracted one. In the western part of the area, some reflec-

tions were obtained from caps of salt domes as well as from the underlying salt-bearing basement drops, 2700-3000 m down to 4500 m from west to center. The second profile shows the basement's drop from 4500 down to 8500 m over a distance of 30 to 40 km between the borehole No. 1 at Verkhovo on the north and Tormosino on the south. A map of the Precambrian basement was prepared as the result of this work. Recommendations are offered for further investigations. G. Shekhtman.

**The Henley Lead-Extrusion Machine.** — (*Electrician, 1935, 115, 148;* also *Elect. Times, 1935, 88, 103;* and *Elect. Rev., 1935, 117, 118.*)—A continuous cable-sheath extrusion press has been perfected by W. T. Henley, Ltd., using the principle of a screw extruder. The machine is illustrated and briefly described. Its length from back to front is only about 12 in., and on account of the rigid construction, extremely close dimensional limits can be maintained in the extruded sheath. The usual oxide inclusions and seams are eliminated by the continuous nature of the extrusion.—J. C. C.

Title : On the Improvement of Breeding

Orig Pub : Ptitsevodstvo, 1956, No 4, 28-29

Abstract : The Tikhoretsky government hatchery of turkeys was organized in 1952. During the recent years, the productivity of the local turkeys has increased considerably: average number of eggs layed yearly from 15-25 to 56 eggs; the average weight of the young ones, from 4 to 4.4 kg (2900 young females). The increase in the productivity of turkeys occurred mainly due to a more rational feeding. Only females laying not less than 51 eggs are used for breeding, and only the little turkeys from females of live weight not less than 4.1 kg, which layed up to May 1, not less than 21 eggs.

AUTHOR: Aristov, V.S.

TITLE: Anisotropy of Mechanical Properties of Welds in Thick Plates Welded with Austenitic Electrodes

PERIODICAL: Avtomaticheskaya svarka, 1960, No. 9, pp. 43-47

TEXT: The purpose of the described investigation was to determine the mechanical properties of butt welds in 50 mm steel sheets made with austenitic electrodes from C8-X22N15 (Sv-Kh22N15) wire and a varying arc length, and to use the data for welding with other austenite class electrodes as well. The base metal was chrome-nickel-molybdenum steel plate with edges bevelled with 60°V. The high tendency of nichrome alloys to transcrystallization resulted in a clearly columnar weld metal structure despite the high number of weld layers (Fig. 2). This structure is the cause of the anisotropy of the mechanical properties across the depth and the three axes shown (Fig. 3). Higher strength in the bottom weld portion appears to be due to a higher content of base metal. Tensile strength is at the lowest  
Card 1/3

S/125/60/000/009/007/017  
A161/A130

Anisotropy of Mechanical Properties of Welds in Thick Plates Welded with Austenitic Electrodes

along the  $Oy$  axis (Fig. 3) in the top portion; along the  $Oz$  axis it is the average between the strength values in the  $Ox$  and  $Oy$  direction. Elongation along  $Oy$  is considerably lower than along  $Ox$  and  $Oy$ . The longer arc considerably increased the anisotropy and drastically reduced the plasticity along  $Oy$ , lowered the strength and elongation in the top weld portion compared with the bottom, gave higher accumulation of non-metallic inclusions in the top arc than in the short arc, and lowered the strength in the fusion boundary between the base and weld metal. It is concluded that the long arc must not be used for welding with austenitic electrodes. There are 5 figures and 4 references of which 3 are Soviet and 1 English.

TITLE: Inspection of normalized carbon steel 20C (20S) welds

PERIODICAL: Sudostroyeniye, <sup>9</sup>no.1, 1963, 51-54

TEXT: This cheap steel of not less than 35 kg/mm<sup>2</sup> yield strength was investigated for weldability and its potential use in ship building. The investigation included: determination of the mechanical properties of the seam on Gagarin samples and the weld joint using destructive bending tests; determination of the impact strength of the seam metal as well as the zone of thermal penetration at temperatures above and below freezing point; macro- and micro-studies of the seam metal and the zone of thermal penetration; determination of the brittleness temperature of the seam metal; bending tests on samples with a longitudinal bead; tests for cracking using the method of K.G. Nikolayev (Svarochnoye proizvodstvo, no.9, 1956); and testing of welded beams for dynamic loads. Hardness tests were also carried out through the zone of thermal penetration, seam and the parent metal for  
Card 1/2

Inspection of normalized carbon ... S/229/63/000/001/002/004  
E202/E192

manually and automatically welded samples. It was concluded on the basis of the above tests that using automatic welding on the above steel with a welding electrode CB -08A (Sv-08A) [according to ГОСТ 2246-60 (GOST 2246-60)] combined with a flux mark OCU -45 (OSTs-45), and in the case of manual welding using electrodes УОМН 13/45 (UONI 13/45), secures welds of good strength properties at static load and withstanding well the effects of dynamic loads. It was further concluded that this steel does not show any crack forming tendencies during welding in conditions of temperature down to -25 °C. The welding did not cause any lowering of the metal strength in the zone of thermal penetration nor did it reduce the impact strength as a result of the thermal cycle of welding. There are 4 figures and 3 tables.

TITLE: Production of plated formed iron by electric-arc fusing and rolling

SOURCE: Stal', no. 2, 1964, 149-152

TOPIC TAGS: plated iron, steel, electric arc fusing, profile iron, SVLKh18N9T electrode, MS 1 steel, ADS 1000 2 welder, AN 26 flux, stainless steel, SVLKh18N9T solder, rolling mill, 620 rolling mill, 450 rolling mill, 400 rolling mill

ABSTRACT: The authors describe a new technique for plating formed iron of different shapes. Several layers of stainless steel were fused onto the samples by the automatic multi-electrode welding method. The chemical composition of the metal plate proved satisfactory (Cr  $\geq$  16%, Ni  $\geq$  8%) when the MS-1 steel and 3-mm SVLKh18N9T electrodes with AN-26 flux were used. The automatic welding assembly ADS-1000-2 was designed to produce simultaneous operation with three electrodes.

Card 1/2

ACCESSION NR: APh0114252

Samples were rolled in mills 620, 450, and 400. Tests showed a strong union of plate with the base metals. In structure, the first layer of the fused-on metal proved to be martensitic and the following layers austenitic. It was determined that the optimal thickness of the metal plate was 1-2 mm. The samples withstood tests for intergranular corrosion even when the angle of bending was 180 degrees. Orig. art. has: 2 tables, 4 figures, and 4 formulas.

Obshchestva* (Mém. soc. russ. minéral.) 77, 211-2 (1946). --Mica-like aggregates of pyrophyllite were detected in the lower horizons of the oxidation zone of pyrite deposits from Malkain, Kazakhstan.  $n_D = 1.600$ ;  $n = 1.588$ ;  $\alpha = 1.531$ ; optically neg. Paragenesis with native S, in quartz-lignite-"sand," esp. in cavities or veins in S, which also contain barite. The Al<sub>2</sub>O<sub>3</sub> of the hypergenic pyrophyllite crystal is evidently derived from solns. of pH about 2.0 contg. Al sulfate circulating in the oxidation area. By a hydrolysis, and a secondary reaction with the neg.-charged silica hydrogel present in the soln., the Al hydrosilicate was pptd. The paragenesis with S, barite, and also native Au is most characteristic for these reactions in colloid out. W. Fritzel

TITLE: The Origin of Amazonite Granites in the Eastern Trans-Baikal Region (K voprosu o proiskhozhdenii amazonitovykh granitov v Vostochnom Zabaikal'ye)

PERIODICAL: Tr. Mosk. geol-razved. in-ta, Vol 29, pp 52-56-1956

ABSTRACT: Several small masses of amazonite granites are known in the eastern trans-Baikal region. They are associated with specific rare-metal mineralization. A mass, forming a steeply dipping dike-like body (400 to 500) was studied. The amazonite granites consist of microcline-amazonite (30 percent, occurring in grains of irregular outlines, and replaced by quartz), quartz (30 percent), albite

The Origin of Amazonite Granites (Cont.)

(Ab<sub>94-95</sub>, 30 to 40 percent), and also zinnwaldite, topaz, and accessory minerals: cassiterite, fluorite, zircon, wolframite, and others. Topaz is encountered in the rock in large irregular segregations, replacing and cementing albite and microcline. The mineral also occurs as a fine-grained variety filling interspaces between other minerals and fractures in them. Zinnwaldite is found with topaz in indistinct relationship. Its optical properties are  $n_g = 1.566 \pm 0.002$ ,  $n_p = 1.540 \pm 0.002$ ,  $2V = \sim 25^\circ$ , and it is weakly pleochroic. Recalculation of the chemical analyses of the amazonite granites according to the method of A. N. Zavaritskiy indicates that the rocks belong to strongly alkalic types, oversaturated in  $SiO_2$  and  $Al_2O_3$ . The extreme similarity in a number of characteristics of the amazonite granites with the characteristics of some muscovite granites that have been formed by autometasomatic transformation of biotite granites and the presence of large quantities of topaz and zinnwaldite in the amazonite granites, and also the presence of cassiterite, wolframite,

and other minerals that contain rare and disseminated elements lead the authors to suggest that the amazon granites were formed by crystallization of a magma approximately the composition of pegmatite and derived from the differentiation of common biotite-granite magma. Rapid crystallization of the magma at low temperatures and pressures was responsible for the absence of secondary differentiation and for the elimination of the volatile constituents. These latter gave rise to greisenization of the host sand-silt rocks up to the final consolidation of the mass.

Povedeniye zolota v zone okisleniya zoloto-sul'fidnykh mestorozhdeniy  
(Behavior of Gold in the Oxidation Zone of Gold-Sulfide Deposits)  
Moscow, Gosgeoltekhizdat, 1958. 266 p. 3,000 copies printed.

Ed. of Publishing House: V.P. Skvortsov; Tech. Ed.: K.V. Krynochkina

PURPOSE: This book is intended for geologists, mineralogists, and other scientists studying gold-bearing ores and gold deposits.

COVERAGE: The work attempts to create a practical basis for appraising the importance of primary and secondary ore zones containing gold deposits resulting from hypergenetic migration. Minerals containing native gold in macroscopic, microscopic, and submicroscopic quantities, as well as the regions in which these minerals occur, are indicated. The authors cite references to studies made on the genesis of hypogene and supergene gold. Gold solution and its reaction in liquids having a different chemical composition are

Card 1/4

Behavior of Gold in the Oxidation Zone (Cont.)

SOV/2128

discussed, and findings from numerous experiments are analyzed. The Maykain and Dzhusaly deposits of Kazakhstan and the Blyava and Novyy Sibay deposits of the Southern Urals are analyzed geologically and mineralogically and the results presented in tables and graphs. Results of microscopic analysis of gold are also discussed and illustrated. This work has been completed under the direction of V.M. Kreyter who wrote Chapters I, V, and VI. Chapter III and the first and second parts of the Chapter II were written by V. V. Aristov. Chapter VII and the third part of the Chapter II were written by I.S. Volynskiy. V.V. Kuvichinskiy wrote the first part of Chapter IV. Numerous Soviet geologists and mineralogists are mentioned in the text. The authors thank P.S. Belov, former Chief Engineer of the Zolotorazvedga Trust, I.N. Plaksin, T.N. Shadlun, D.S. Kreyter, and G.G. Rusetskaya. The book contains numerous pictures, graphs and tables. There are 120 references: 78 Soviet, 27 English, 12 German, 3 French.

TABLE OF CONTENTS:

Foreword	3
Introduction	5
Card 2/4	

Behavior of Gold in the Oxidation Zone (Cont.)	SOV/2128
Ch. I. Modern Concept of Hypogene and Supergene Gold	8
1. Hypogene gold	17
2. Supergene gold	23
3. Solution of gold	
Ch. II. Geological and Mineralogical Observations	27
1. Deposits at the Maykain ore field (Kazakhstan)	27
General information	27
Ground and ore waters	28
Characteristics of oxidation zones in certain deposits of the Maykain ore field	31
Mineralogy of the sulfide zone	55
Mineralogy of the oxidation zone	60
2. Deposits at Dzhusaly (Kazakhstan)	112
General information	112
Ground and ore waters	113
Sulfide heads	115
Mineralogy of the sulfide zone	117
Oxidation zone	120
3. Deposits at Blyava and Novyy Sibay (Southern Urals)	162
Card 3/4
