On the Almost-periodical Solutions of Some Classes of Integral-Differential
Equations p. 17

TRANSACTIONS OF THE 2ND REPUBLICAN CONFERENCE ON MATHEMATICS AND MECHANICS
(TROY VYRHOV NERIUBLIKANS'KII KONFERNITSII PZ MATEMATIKI I MECNIVIKI), 16th
pages, published by the Publishing House of the AS UkrSSR FFI, KIYV-ATA, USSR, 1962

AUTHOR: Artyushenko, L.M.

SOV/140 58-4-2/30

TITLE: On the Application of Fourier Series for the Determination of Almost-Periodic x Solutions of Equations in Mean Values (C primernyy ryadov Fur'ye k nakhodcheniyu pochti-periodicheskikh x reshenii uravneniy v srednikh znacheniyakh)

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy Ministerstva vysshego obrazovaniya SSSR, Matematika, 1958, Nr 4, pp 21-27 (USSR)

ABSTRACT: Let $f(x)$ be almost-periodic, $M_x \{f(x)\} = \lim_{T \rightarrow \infty} \frac{1}{T} \int_0^T f(x)dx$ and

$g(x) = M_t \{f_1(x-t)f_2(t)\}$, where f_1 and f_2 are almost-periodic.

Theorem: $M_x \{g(x)e^{-i\lambda x}\} = M_x \{f_1(x)e^{-i\lambda x}\} \cdot M_x \{f_2(x)e^{-i\lambda x}\}$.

Consider the integral equation of first kind (equation in mean values)

$$(1) \quad f(x) = M_t \{K(x-t)u(t)\},$$

where $f(x)$, $K(x)$ are given functions and $u(x)$ is the sought function.

Let $f(x) = \sum_{k=-\infty}^{\infty} c(\lambda_k) e^{i\lambda_k x}$ be uniformly convergent. Let $b(\lambda_k) = M_x \{K(x)e^{-i\lambda_k x}\}$.

Card 1/2

On the Application of Fourier Series for the Determination
of Almost-Periodic Solutions of Equations in Mean Values SOV 140 58-4-2/30

Theorem: If the series $\sum_k \frac{|a(\lambda_k)|}{|b(\lambda_k)|}$ converges, then (1) has the

almost-periodic solution $v(x) = \sum_k \frac{a(\lambda_k)}{b(\lambda_k)} e^{i\lambda_k x}$.

A similar result is given for the integral equation

$$u(x) = M_t \left\{ K(x-t)u(t) \right\} + f(x)$$

and the integro-differential equation

$$\sum_{m=0}^n c_m \frac{d^m u(x)}{dx^m} - M_t \left\{ \sum_{l=0}^p K_l(x-t) \frac{d^l u(t)}{dt^l} \right\} = f(x).$$

AUTHOR: Artyushenko, L.M.

TITLE: On the conditions for the existence of an almost periodic solution for a class of integro-differential equations

PERIODICAL: Referativnyy zhurnal, Matematika, no. 4, 1962, 60,
abstract 4B276. ("Issled. po integro - differentsial'nym
uravneniyam v Kirgizii". No. I. Frunze, AN KirgSSR, 1961,
159-166) VB

TEXT: The author gives sufficient conditions for the existence of an almost-periodic solution (in the sense of Bohr) of the integro-differential equation

$$\frac{du}{dx} = q(x)u(x) + \lambda \int_0^{h(x)} F(x,t,u(t))dt + f(x) ,$$

where the functions $h(x)$, $f(x)$, $F(x,t,u)$ are almost periodic in x .

ACCESSION NR: AR4039295

S/0044/64/000/003/B080/B080

SOURCE: Ref. zh. Matematika, Abs. 3B377

AUTHOR: Artyushenko, L. M.

TITLE: The existence of analytic, almost-periodic solutions to one class of linear
integro-differential equationsCITED SOURCE: Sb. Materialy* u-y Nauchn. konferentsii Kafedry* vy*ssh. matem.
Frunzensk. politekhn. in-t. Frunze, 1963, 95-99TOPIC TAGS: analytic almost-periodic solution, linear integro differential equa-
tion, matrix coefficient, characteristic polynomial multiple root, characteristic
polynomial simple rootTRANSLATION: The author considers the following system of integro-differential
equations

$$L[u] = \frac{du}{dt} + Au + \int_0^t K(t-s) u(s) ds = f(t),$$

where A is a constant n x n-type matrix;

Card 1/2

ACCESSION NR: AR4039295

$$K(s) = \sum_{j=1}^r Q_j(s) e^{-\beta_j s};$$

Q_j is a polynomial of degree m_j with matrix coefficients; $z = x + iy$ is a complex variable; $f(z)$ is an n -dimensional vector function which is analytic in the region

$$\{\alpha, \beta\} = \{x : \alpha < x < \beta, y : -\infty < y < +\infty\}; \alpha - \gamma + i\lambda; \alpha < \gamma < \beta.$$

$f(z)$ possesses property M if it is either almost-periodic in region $\{\alpha, \beta\}$, or periodic with period $i\omega$. In the case of multiple roots of the characteristic polynomial of the system $L[u] = 0$, as in the case of simple roots, theorems are proven which give necessary and sufficient conditions under which system (1) has a solution possessing property M if the function $f(z)$ possesses property M. Corollaries to these theorems are derived. V. Fyodorov.

Title : Ivanov Shoots in the Pine.

Orig Pub : Botan. zh., 1957, 42, No 5, 741-745.

Abstract : The results are given of a morphological-anatomical analysis of *Pinus silvestris* L. and *P. banksiana* Lamb in the Otryadnoye Nursery of the Botanical Institute (Karelian Isthmus) where in different years up to seven growth increments were noticed in these species. The needles of the fifth and seventh growth increments did not attain normal dimensions and had a less intensive coloring. Each new growth increment is connected with renewal of the cambium activity and formation of supplementary yearly growth rings!.

SOV/77-4-1-3/22

AUTHORS: Artyushin, L.F., and Semenova, N.F.

TITLE: Non-Linear Characteristics of Color Separation
(Nelineynyye tsvetodelitel'nyye kharakteristiki)

PERIODICAL: Zhurnal nauchnoy i prikladnoy fotografii i kine-
matografii, 1959, Vol 4, Nr 1, pp 20-31 (USSR)

ABSTRACT: In order to determine the characteristics of color separation with utmost precision, the authors used, in the experimental part of their work, the color-sensitive layer of the DS-2 negative film. The test objects were exposed to the color sensitometer NIKFI TsS-2, the photographic processing was done under factory conditions, the developed samples were measured with the aid of the color-densitometer NIKFI TsD-4, and the surface concentrations of the negative colorant were counted on the basis of the data obtained by measuring. Since the linear formula does not permit a counting of the effective densities within entire interval of the surface concen-

Non-Linear Characteristics of Color Separation

tractions of colorants with the necessary accuracy, a more precise quadratic formula was built on the basis of prolonged color separation experiments. The coefficients of this formula were called non-linear color separation characteristics of the light-sensitive receiver. The numerical values of these coefficients are determined by individual effective densities and non-linear deviations. The authors show that in the case of disturbed additive properties of the effective densities the calculation error may reach plus/minus 0.02 at individual instances if the linear formula has been employed, while the error does not exceed a mean plus/minus 0.06 when the quadratic formula was applied in the calculation. The quadratic formulae for given cases are established and discussed.

AUTHOR: Artyushin, L.F.

TITLE: Non-linear Color Correction With Intensifying Negative Masks. I: The System of the Process and its Color Separation Experiments

PERIODICAL: Zhurnal nauchnoy i prikladnoy fotografii i kinemato-grafii, 1959, Vol 4, Nr 3, pp 202-209 (USSR)

ABSTRACT: The author has developed a method of color correction with the aid of non-linear intensifying negative masks in the case of non-linear correlation between effective optical densities and surface concentrations of the colorants. The article, which is to be completed by a study concerning the method of calculating the sensitometric magnitudes of intensifying negative masks, is divided into three parts. The first part is a description of methodical color separation experiments, which permit the determining of the characteristics of the color process. The experiments included con-

Card 1/4

SOV/77-4-3-7/16

Non-linear Color Correction With Intensifying Negative Masks.
I: The System of the Process and its Color Separation Experiments

sideration of color shifts as due to (1) the mutual effect of color transfers in imbibition and polygraphic processes and (2) the mutual effect of layers in positive color films. In order to avoid these shifts, the authors used specially prepared test materials. The second part is a description of one of the methods of non-linear masking. This method is based on the use of so-called "intensifying" negative masks fit for correction of color separation black-white negatives and color negatives. These masks are different from the usual type (1) by the method of their preparation and (2) by their behavior towards the gradational characteristics of the color process. The printing of these masks is performed from negatives coupled with intermediate positives. The negative image must be color separated in one spectral region, the positive image - in another.

Card 2/4

SOV/77-4-3-7/16

Non-linear Color Correction With Intensifying Negative Masks.
I: The System of the Process and its Color Separation Experiments

Due to the coupling of negative with positive, the gradation of gray tones on the mask can be eliminated. The use of intensifying masks, therefore, does not have an effect on the gradational characteristics of the color process. This circumstance permits the use of photographic materials with non-linear characteristic curves for the preparation of these masks. The third part contains the equation of color transfer for the masks (10) and the equation for the gradational characteristics of the color process (11). Together with the equation for the color separation characteristics of the color process ((1) in the first part), these equations are necessary and sufficient for a quantitative expression of color transfer. There are 2 graphs and 7 Soviet references.

Abstract: Tests were made on 3 series of mice: one, subjected to general single irradiation of 350 r with preliminary and subsequent cooling in a refrigerator under 4°; another, irradiated with the same dose without cooling; and the third, subjected to cooling without irradiation. In the I series, in the first 2 days leucocytosis (up to 18,000 in 1 mm³) and from the 5th day leucopenia (5500) and
