"A Study on the Physiological Activity of Certain Muscular  
Relaxants in Radiation Sickness."

Bucharest, Revista Sanitara Militara, Vol 59, No 3, May-Jun 63,  
pp 547-551.

Abstract: Reviews the literature on the subject and presents  
results of a study for the quantitative evaluation of the  
curative value of d. chlorhydrotubocurarine (Burroughs Wellcome  
"Tubarine") and galamine triiodoethylate (Specia "Flaxedil")  
in acute radiation sickness based on the head-drop test in  
rabbits exposed to ionizing radiation (400 r total). The curarizing  
action of Tubarine is slightly lower in irradiated than in  
non-irradiated animals --about 7 percent average-- while that  
of Flaxedil is unchanged.

Includes 14 references, of which 9 are Western.

Title : The Watering Regimen During Periodic Irrigation of Rice.

Orig Pub : Kratkie itogi nauch.-issled. rabot za 1955 god, Krasno-  
dar, "Sov. Kuban", 1956, 112-116

Abstract : The maximum yield of rice in the lowlands of Kuban  
(38.9 centners/hectare) was obtained with inundation.  
The irrigating regimen of rice upon periodic irrigation  
should be based on practical utilization of water during  
phases of its development. The optimal moisture of the  
soil is 70 to 80% of the field moisture capacity; the  
irrigation norms should be figured on humidifying the  
soil to a depth of 60 to 80 cm.

Title : Certain Problems of Growing Potatoes for Seed in  
Koprovishenskiy Rayon.

Orig Pub : Sel'skoston. ml"1, 1956, 1, No 10, 593-597

Abstract : A detailed exposition is given of the agricultural engineering techniques of cultivating potatoes for seed. In Bulgaria the sick plants are removed, and a mass selection is made of the healthiest and best-developed plants, during the flowering phase. When thus sorted out, the material used in planting increases its productivity by 7-28%. To acquire seed material which is not affected by virus diseases it should be harvested before the stem dries; this applies particularly in the case

TITLE : Experiments in the Production of Dessert Wine Derived from the "Shiroka Melnishka" Grapes  
ORIG. PUB. : Lozarstvo i vinarstvo, 1958, 7, No 6, 52-53

ABSTRACT : The climatic conditions of the Southern Bulgarian regions permit growing of grapes for the production of dessert wines. In the manufacture of such wines from the Shiroka Melnishka variety of grapes, having 25-26% sugar content, the fermentation is carried out up to the alcohol content of 11.5 volume %. The grape concentrate is then introduced and the fermentation is repeated. A sample of dessert wine, having 15.1 vol.% alcohol and 16.6% sugar content was well appraised by the specialists.
