water. The emission spectra were measured with a DFS-13 spectrograph. The temperature of the arc was determined from two pairs of copper lines: 5105.5 : 5153.2 Å and 5105.5 : 4530.8 Å. Using the theoretical value of the Stark constant and the obtained experimental values, the article cites a value of  $(1.3 \pm 0.3) 10^{16} \text{ cm}^{-3}$  for the concentration of charged particles in a plasma in a direct current arc between copper electrodes under water. The concentration of charged particles increases compared to the same arc in the atmosphere, for which a value of  $10^{15} \text{ cm}^{-3}$  is quoted. The temperature rises to approximately 1500 K. "In conclusion, the authors wish to thank M. A. El'yashhevich for his constant interest in the work and for his discussion of the results." Orig. art. has: 3 tables

of Lymph in the Development of Peptone Shock)

Orig Pub : Byul. Eksper. Biol. i Med., 1957, Vol. 44, No. 11,  
45-48

Abstract : In 17 dogs shock was produced by the intravenous injection of a 40 percent solution of peptone (P) in physiologic saline solution (0.7 gm/kg). 20-30 seconds after the injection of P the blood pressure fell to two-thirds its original level. By five minutes after the injection, the concentration of protein (CP), the ratio between the protein fractions, and the A/G ratio in the serum of the dogs had not changed, whereas in the lymph of the thoracic duct the CP had increased

"Investigation of the Adsorption Hysteresis with a Physically Modified Technique"

Leipzig, Zeitschrift fur Physikalische Chemie, Vol 231, No 5-6, 1966,  
pp 382-390.

Abstract: This paper described the method for the determination of the geometric factor,  $\alpha$ , characterizing the differential curvature distribution of the surface, by employing basically the technique described by the author Ibid., Vol 225, 1964, p 273. It was found that this subject is closely related to capillary-condensation adsorption hysteresis. The theory and practice of the technique was described in some detail, and its applications were outlined.

TITLE: Determination of surface distribution functions according to curvature in  
porous objects

SOURCE: Bulgarska akademiya na naukite. Doklady, v. 18, no. 6, 545-548

TOPIC TAGS: porosity, adsorption, distribution function, surface property, desorption

ABSTRACT: Adsorption methods are widely used for the study  
of pore properties in adsorbers and catalysts. Numerous authors developed  
methods for the determination of pore distributions according to volume and  
area by sorption in the domain of capillary condensation and polymolecular  
covering (see, e.g., E. P. Barret, P. Q. Joyner, P. P. Hallenda, J. Amer. Chem.  
Soc., 73, 1951, 373; M. M. Dubinin, ZhFKh, 30, 1956, 1840). In his earlier  
paper (Z. phys. Chem., 225, 1964, 273) the author characterized the pore size  
by the curvature of the surface elements on which the condensation according  
to the Thomson-Gibbs equation occurs; he proposed also an equation for the  
surface change during isothermal sorption which contains a parameter  $\alpha$   
characterizing the shape of the above-mentioned surface elements. In the  
present study of the adsorption hysteresis, the author determines experimentally  
the value of  $\alpha$  for adsorption and desorption. Results show that the  
capillary condensation plays the same role during the filling and emptying of  
pores. The article contains detailed descriptions of the experiments with 6  
aluminosilicates and 5 industrial catalysts proves. This paper was presented by  
Academician R. Kaishev on 12 February 1965. The author thanks Prof. Bliznakov of the BAN  
for useful discussions of the results. Orig. art. has: 4 figures. Orig. art. in

TITLE: The work of Soviet Army railroad construction forces

SOURCE: Tyl i snabzheniye sovetskikh vooruzhennykh sil, no. 8, 1966, 69-75

TOPIC TAGS: military engineering, railway construction, construction machinery

ABSTRACT: The duties and responsibilities of the Soviet Army railroad construction forces in the current five-year plan and the improved technical means available for building railroads are discussed. The new semiautomatic rail assembly lines consist of four basic mechanisms: crosstie feeder, automatic drilling unit, conveyer and automatic assembly unit. The following operations are performed automatically: the delivery of the crossties to the drilling unit, drilling of holes in the crossties and their treatment, the driving of spikes and the ejection of the assemblies. The pre-assembled 25-30 m track lengths are laid by type PB-2 and PB-3 equipment. Photographs of some of the heavy equipment used in railroad construction are shown. Orig. art. has: 7 figures.

AUTHORS: Bakarev, P.I., and Prytkov, V.N., Ingenieurs. 184

TITLE: Centrifugal method of manufacturing reinforced concrete masts supporting overhead electrical wiring.  
(Izgotovleniye tsentrifugirovannykh zhelezobetonnykh opor kontaktnoi seti).

PERIODICAL: "Beton i Zhelezobeton" (Concrete and Reinforced Concrete), 1957, No.2, pp. 54 - 57 (U.S.S.R.)

ABSTRACT: The above mentioned masts were designed according to plans of Gipropromtransstroy of the Soviet Ministry of Transport. They are employed in the electrified Kurgan - Makushino Yuzhno-Ural line. The masts are 11.5 m high, the weight is 1.7 ton, the mast being bolted to the concrete foundation by steel shoes. The reinforcement consists of a base ring, longitudinal bars and spiral reinforcement. The base ring and welded on lugs are made of steel St- 3. Concrete Mark 400 is used. The external minimum diameter of the mast is 29 cm and the tapering 1 1/2 %. The basic equipment is the centrifuge which is driven by two 3-phase dynamos of 36 kilowatt with 4 speeds: 175, 270, 350 and 540 rot./min. The steel formwork in which the centrifuging is carried out is made of 8 mm thick steel sheeting. The manufacturing process has the following phases: the formation of the reinforcement, mixing of concrete, the preparation of the forms for centrifuging, the centrifuging process, the curing of the masts in the forms,

184  
Centrifugal method of manufacturing reinforced concrete masts supporting overhead electrical wiring.

the striking of the forms and the final curing in chambers. The bottom rings are fixed by welding. The longitudinal reinforcement is of 5 to 6 mm dia. The sand for the concrete mix has a modulus of coarseness of 2.46 with an average grain diameter 0.37 mm, the coarse aggregate having a content of 6 1/2% of stones over 20 mm and 2 1/2% less than 5 mm. The nominal concrete mix is 1 : 1.36 : 2.17, the water:cement ratio being 0.5. The quantity of used cement is 460 kg/m<sup>3</sup>. The curing was carried out for 3 to 4 hours, the temperature being 50°C during the first hour and 80°C during the rest of the process. The final curing in the chambers is carried out for 8 hours at 70 to 80°C. 4 masts were tested from each batch of 100 masts manufactured by this method. The masts were erected with the aid of lorry-mounted cranes which had a capacity of 5 to 10 tons. Steel consoles are fixed after erection. There are 4 photographs, 4 diagrams and 1 table.

Ed.: F.T. Kashirin; Tech. Ed.: M.G. Anokhina.

PURPOSE: This book is intended for research scientists and teachers in institutes of higher education who may be interested in developments and research trends in various scientific fields.

COVERAGE: The book contains 12 articles by persons affiliated with the Academy of Sciences Kirgiz SSR on studies in physical chemistry, industrial chemistry, applied physics (blasting dynamics), electric power engineering, electronics, agronomy, metallurgy, pure mathematics, etc. A bibliography of 1957 publications of the Academy includes works on history, archeology, economics, linguistics, literature, geology, biological sciences (botany, zoology, medicine), and technology. No personalities are mentioned.  
References accompany most of the articles.

81. A method for the artificial cooling of the cooling air of alternators. (In German) A. Bukay, I. Szles  
Periodica Polytechnica, Electrical Engineering, Vol. 2,  
1958, No. 1, pp. 39-46, 2 figs.

As a measure for overcoming problems of cooling alternators it is suggested that artificially cooled air or hydrogen be used for dissipating loss heat arising in the alternators instead of cooling water. The arrangement of a steam ejector-type cooling machine is described that is simple of design and can be readily installed in any heat-engine power station. Strength calculations for alternators equipped with artificial cooling are also published. The computations take into account the increase in the life of the machines equipped with cooling, the type of cooling applied, the conditions of load and the original strength calculations. The described calculation is a decisive aid for choosing the most adequate cooling system.

AUTHOR: Bakay, A.S.; Lyubarskiy, G.Ya.; Roghkov, V.V.

TITLE: Asymptotic solution of a diffusion problem and its application to the theory of cyclic particle-storage devices

SOURCE: Zhurnal tehnicheskoy fiziki, v. 35, no. 9, 1965, 1525-1531

TOPIC TAGS: particle motion, particle scatter, cyclic accelerator<sup>19</sup>, physical diffusion, stochastic process, mathematic method, mathematic operator

ABSTRACT: The authors show largely by verbal arguments that if a system has an asymptotically stable orbit and is destroyed when its representative point crosses a certain closed surface in phase space, then under certain conditions its mean life time when it is subjected to stochastic forces can be calculated by finding the smallest eigenvalue and the corresponding eigenfunction of the Fokker-Planck-Kolmogorov operator that describes its motion. This method is employed to calculate the mean lifetime of a charged particle in a storage ring when it is subjected to stochastic forces arising from collisions with residual gas molecules and from the quantum nature of the radiation process. The equations for the radial and the

Card 1/2

L 3623-66

ACCESSION NR: AP5024025

phase oscillations are assumed to linear and the stochastic forces to be uncorrelated. The corresponding Fokker-Planck-Kolmogorov operator is derived and it is shown that the eigenvalue problem allows of separation of variables. The smallest eigenvalue and its eigenfunction are calculated by a perturbation method that depends on the damping constants in the equations of motion being large. Formulas are presented for the distribution of the accumulated particles and for the mean lifetime of a particle. Orig. art. has: 47 formulas.

TITLE: Resonant effect in nonlinear systems

SOURCE: Differentsial'nyye uravneniya, v. 2, no. 4, 1966, 479-491

TOPIC TAGS: nonlinear differential equation, nonlinear theory, resonator, oscillator theory

ABSTRACT: The study of nonlinear systems subjected to outside forces is very difficult, hence the author selected a system which can be simply and thoroughly described and which permits the investigation of effects caused by nonlinearity. An oscillator whose frequency  $\omega$  depends on its energy is subjected to an external sinusoidal force with a slowly changing frequency  $\nu$  and amplitude. The amplitude is such that  $\Delta\nu/\nu \ll 1$ , where  $\Delta\nu$  is the change in frequency per one oscillation period. The presentation of the basic and averaged equations is followed by an extensive study of the oscillators in the absence of friction and with constant parameters of the external force, in the presence of friction, and when the driving force parameters become variable. Constant force parameters yield asymptotically stationary states; the variable parameter case is handled by means of adiabatic

B

Card 1/2

UDC: 517.934

L 44163-66

ACC NR: AP6023966

invariants yielding limiting states of the system, some of which are stable. An adiabatic change in  $v$  may lead to an adiabatic change in  $w$ . The author thanks G. Ya. Lyubarskiy for numerous discussions and valuable advice. Orig. art. has: 64 formulas and 3 figures.

COUNTRY : USSR M  
CATEGORY : Cultivated Plants - Industrial, Cleiferous, Sugar.  
JRS. JOUR. : RZhBiol., №.14, 1958, №.63507  
AUTHOR : Bakay, I. M.  
INST. : All-Union Academy of Agricultural Sciences imeni Lenin.  
TITLE : Some Problems of Agricultural Technique and Fertilization  
of Sugar Beets on the Irrigated Lands of Kuybyshevskaya  
Oblast'.  
ORG. PUB. : Dokl. VASKhNIL, 1957, No. 4, 14-17  
ABSTRACT : Field experiments conducted in 1952-1953 at Timashevskiy  
beet sovkhoz in Kuybyshevskaya oblast' showed that on  
plantings of sugar beets with irrigation, 4 cultivations  
(one prior to the start of irrigation; the remaining ones -  
after irrigations) should be carried out. Each successive  
cultivation should be deeper than the preceding ones.  
Performance of deep (deeper than 13 cm) and shallow (to 8  
cm) cultivations is inexpedient. Application of dressings,  
timely cultivations and spaces of 60 cm between the rows  
on an area of 400 ha secured in 1953 an increase in the  
yield by 79% in comparison with 1951. --- A. M. Smirnov

Title : Best Irrigation Under C. Conditions of Kuibyshevskaya Oblast.

Orig Pub : Selskonnaya svadeba, 1957, No 4, 19-24.

Abstract : The field experiments on the collective farm "Tiraspol'skaya" in the Kuibyshevskaya Oblast conducted on slightly and highly leached chernozem confirmed the great economic effectiveness of beet sowing. The sowings of beet were distributed over perennial grasses, spring wheat and potatoes. The irrigation increased the yield by 3-4 times and assured steady crops of 500-600 centners/ha. Not less than 3-4 waterings should be made. The highest yield is secured by maintaining high moisture level (72-100% of the moisture capacity of the field) during the entire period
