AUTHOR: Malenberg, N. Ye.; Balandin, A. A.; Kukina, A. I.

TITLE: Catalytic properties of iron orthophosphate. Report No. 2. Alkylation of benzene and its homologs and derivatives

SOURCE: AN SSSR. Izvestiya. Seriya khimicheskaya, no. 0, 1965, 1565-1570

TOPIC TAGS: Iron compound, alkylation, alkyl benzene //

ABSTRACT: The catalytic properties of iron orthophosphate FePO₄ were studied in the alkylation of benzene and its homologs with haloalkyls of various structures. Benzene, toluene, ethylbenzene, cumene, chlorobenzene, and phenol were alkylated with *sec*-propyl chloride and bromide, and with *tert*-butyl chloride. The condensation of benzene and its derivatives with aliphatic monohalo derivatives took place as follows:

Card 1/2

09010209

L 5063-66

ACCESSION NR: AP5026508

9

FePO₄ was shown to be active and specific in the liquid-phase alkylation of benzene and its homologs. The amounts of monoalkylated products obtained, ranging from 38 to 73%, are comparable to the yields obtained in the presence of such widely employed catalysts as AlCl₃ and FeCl₃. In contrast to the latter, the formation of dialkyl derivatives and of considerable amounts of tars is not observed in the presence of FePO₄. However, reactions of acylation and of alkylation of benzene and its homologs by haloalkyls of normal structure were not detected. "The authors take this opportunity to thank Ye. N. Rossolovskiy and L. D. Ashkinadze for his comments and assistance." Orig. art. has: 2 tables. ^{44, 55}

TITLE: Some characteristics of the identification and analysis of highly polar nitrogen- and oxygen-containing substances by gas-liquid chromatography

SOURCE: AN SSSR. Doklady, v. 170, no. 3, 1966, 589-592

TOPIC TAGS: chromatography, gas chromatography, amine

ABSTRACT: Continuing their study of the identification of certain strongly polar nitrogen- and oxygen-containing compounds in mixtures, the authors focused their attention on the reaction of catalytic synthesis of piperazine from monoethanolamine, in the course of which over 20 highly polar compounds having very different boiling points and reactivities are formed. A study of various liquid phases and solid carriers (60 columns) showed that these compounds are best separated on polyethylene glycol (PEG-2600 or 2000) deposited (in amounts of 1-0.5%) on NaCl treated with KOH (0.5%). A complete analysis of the mixture on a column with 1% PEG-2600 and 0.5% KOH requires a separation at three temperatures, 63, 102 and 173°C. The effect of the amount of KOH and PEG on the separation was determined. The size and shape of NaCl

TITLE: Investigation of the optimum geometry and stability relationships of hard-alloy milling cutters made from plasticized blanks in machining EI654 steel

SOURCE: IVUZ. Mashinostroyeniye, no. 10, 1966, 142-146

TOPIC TAGS: cutting tool, metal machining, durability, wear resistance, high temperature steel, *REFRACTORY METAL*

ABSTRACT: The author determines the optimum rake and relief for three-sided disc mills in machining EI654 refractory steel. The cutters were made from VK6M and VK10M hard alloys produced in the Profiled Components Laboratory of the All-Union Scientific Research Institute of Hard Alloys. These milling cutters were 45 mm in diameter, 10 mm wide and had 12 teeth. Machining was done without cooling on a 9.2 kw horizontal mill with spindle speeds from 19 to 950 rpm at $\phi=1.26$. Cutter wear was measured at speeds of 8.6-52 m/min and feeds of 0.01-0.07 mm for various cutting depths. It was found that wear takes place chiefly on the clearance surface of the cutting teeth. The results show that the optimum relief for cutters of this type in machining EI654 steel is 12° , the optimum rake being 5° for VK6M cutters and 10° for VK10M cutters.

Fatty oil from kernels of *Schisandra chinensis*. D. A. Balandin. (*comp. rend. acad. sci. U. R. S. S. R.* 20, 354 (1940) (in English)). Kern. of kernels of *Schisandra chinensis* (L.) with ether gave 33.8% of fatty oil possessing a golden yellow color, a resinic odor and a bitter taste. The oil has a high I value, hydroxy acid content and unsaponifiable ratio. On storage the I value decreases. The fatty acids from I had the following composition: stearic acids, 3.7%; resin acids, 8.7; oleic acid, 28.5; palmitic acid, 24.7; 25:2; β -lauric acid, 31.2; 34.0. David R. Ashton
