✓ **Cosalite from the Bismuth ore deposits of Bukuka.** V. P. Barabanov (A. A. Zhdanov State Univ., Leningrad). *Doklady Akad. Nauk S.S.S.R.* 112, 938-41(1957); cf. C.A. 50, 9239. — Bismuthinite and cosalite are typical Bi minerals of the deposits of Bukuka, cosalite forming slender prismatic crystals of sometimes 6-7 cm. long, with a characteristic striation of the {110} zone;  $d. 7.011$ . The polished sections show distinct anisotropy of the mineral, bright-gray in color, with a yellowish tint; hardness 3. Chem. analysis gave Bi 41.84, Sb 0.29, Pb 38.94, Cu 1.86, Ag 0.75, Fe 0.10, S 16.54%, and traces of Te, Cd, Mn, and Mg; the formula is  $2PbS.Bi_2S_3$ , with a slight replacement of Pb by Cu, Ag, and Fe and of Bi by Sb. X-ray powder data are

given. The paragenetic assocn. of cosalite with gilbertite, molybdenite, pyrite, sphalerite, fluorite, calcite, and quartz on druses of the Bi ore veins is typical. There is also a characteristic pulsation of the hydrothermal depositions. In an early stage wolframite and bismuthinite as well as quartz crystd. followed by the cosalite paragenesis, with increasing concns. in PbS and ending in pure galena. A diagram demonstrates the sequence of the Pb-Bi sulfo salts in the system  $PbS-Bi_2S_3-Cu_2S$ .

Card 1/1      Pub. 133 - 3/21

Authors      : Barbanskiy, A. M.

Title         : ~~XX~~  
               : In series transmission of natural color image

Periodical   : Vest. svyazi 3, 6-9, Mar 1955

Abstract     : The physiological characteristics of color reception and in series transmission of natural color image by the Experimental Color Television Station in Moscow, are discussed. Operational principles of color television sets are explained, and technical data is given regarding the form of signal impulses, horizontal and vertical scanning, number of images per second, frequency characteristics of the transmitting path, and the sources of light. Drawings; diagrams; graph.

TITLE: Physiological characteristics of a dog's homotransplanted extremity

CITED SOURCE: Sb. III Vses. konferentsiya po peresadke tkaney i organov, 1963. Yerevan, 1963, 264-265

TOPIC TAGS: dog, homotransplantation, homotransplant viability, cortisone, antibody, blood serum

TRANSLATION: The life span of homotransplanted extremities was increased in 10 dogs by means of cortisone. Viability of the extremity homotransplant was increased by 2½ times and in 1 case was increased to 40 days. An investigation of the immunological reaction by a hemagglutination method showed that cortisone does not inhibit the appearance of antibodies in the recipients' blood serum.

                  and Barbarich, M. V., Engineer

Title         : Contact fatigue of the teeth of gears made by hot rolling

Periodical   : Vest. mash. 35/3, 53 - 56, Mar 1955

Abstract     : An account is given of studies made of the microstructure of gear wheels made by the process of hot rolling, a process which has enormously speeded up the production of these wheels. Tests were made by which it was shown that the surface toughening of the teeth of the wheels, resulting from the plastic deformation of the metal during the rolling, considerably increases the resistance of the teeth to fatigue, making them superior to teeth cut on the milling machine. Illustrations; graphs.
