TITLE: Preliminary report on norimipramine treatment of depressions 2 This paper was presented at the 7th Annual Psychopharmacological Meeting, Jesenik, 20-23 January 1965

SOURCE: Activitas nervosa superior, v. 7, no. 3, 1965, 288

TOPIC TAGS: drug treatment, nervous system drug, pharmacology

ABSTRACT: Norimipramine is a thymoleptic which is effective in the treatment of depressive conditions with prevailing psychomotor inhibition. Its side effects are similar to those of imipramine. The rapid onset of the therapeutic effect is a great advantage in its application. Experiments were conducted on 10 patients. Norimipramine is 5-methylaminopropyl-imino-dibenzyl hydrochloride. "Treatment of Depression by Niamide Infusions."

Prague, Activitas Nervosa Superior, Vol 8, No 4, Nov 66, pp 368 - 369

Abstract: Experiments in treating 22 patients with niamide are described. In 8 patients there was an improvement, in 14 there was none. Where the depression was caused by agitation and anxiety, the drug had no effect. No side effects were observed, but the patients had to receive hypnotics at night to make them sleep. No EEG changes by the drug were observed. The use of Niamide at the present time is rather experimental than general. 1 Table, no references. Submitted at the 8th Annual Psychopharmacological Meeting at Jesenik, 18 - 22 Jan 66.

TITLE: Quality control of refractory materials by methods using ultrasonic vibrations

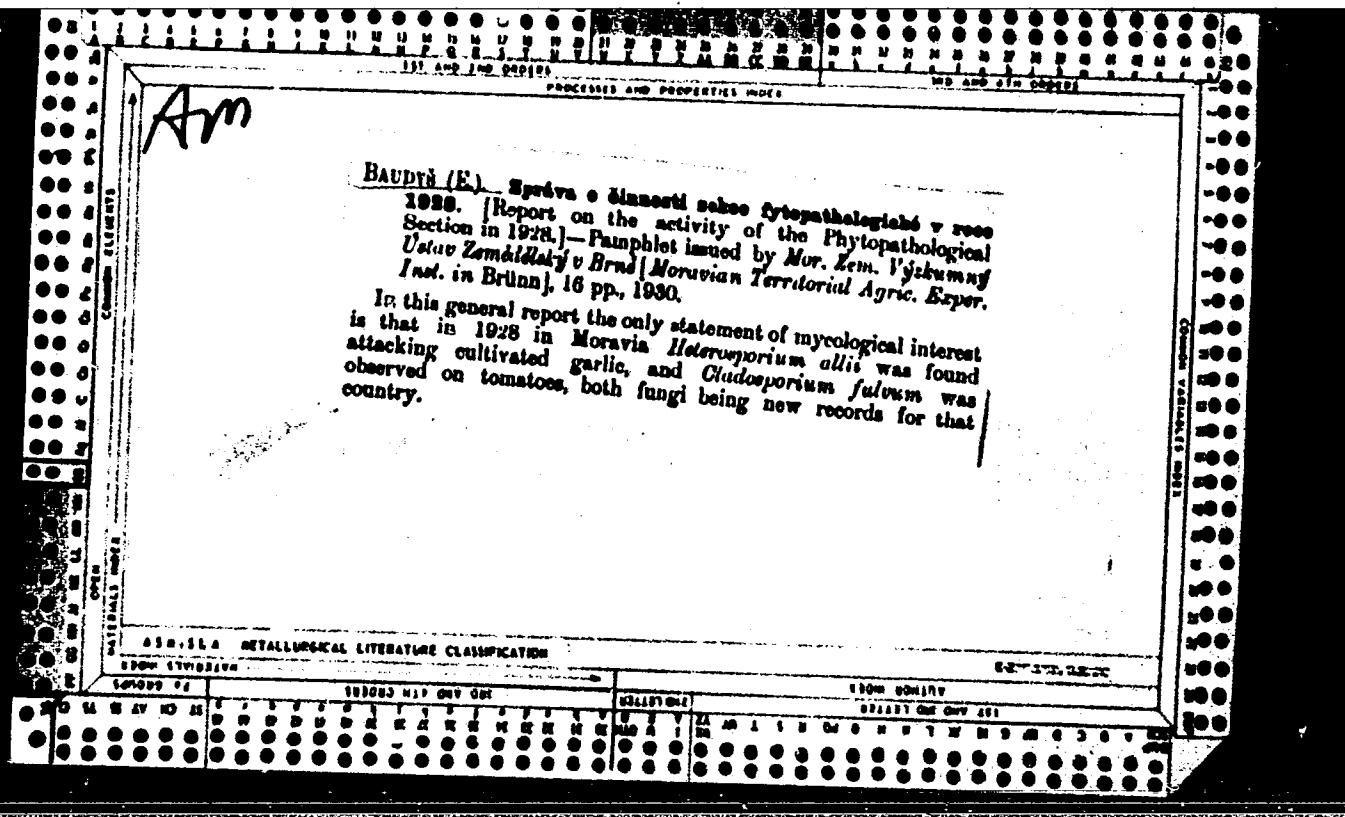

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 21, 1962, 331 - 332,
abstract 21K213 (Épitöanyag, v. 14, no. 3, 1962, 102 - 115
[Hung.; summaries in Russ. and Ger.])

TEXT: Methods of quality control by ultrasonic vibrations of refractory and ceramic goods are described. These vibrations are nondestructive. The principles of the method and the factors which influence the rate at which ultrasonics are propagated within the goods, viz. density, porosity, granulometric composition of the substance, quality of the material etc., are described. An installation for making measurements is described and some practical examples are given. By applying this method a quick and reliable quality test of refractory materials can be carried out not only on selected samples but on complete batches of goods. [Abstracter's note:

BAUDYK (E.). *Padli na ovocnych Stromech a ketich. [Mildews of fruit trees and shrubs.]*—Český Odbor Zemědělského Rady Moravského [Bohemian Branch of the Moravian Agricultural Council]. Brno, Leaflet 32, 2 pp., 1 fig. [Received December, 1930.]

In this leaflet brief, popular accounts are given of the mildews which attack the chief fruit crops in Bohemia, namely, *Podosphaera leucotricha* on the apple and pear; *P. argyranthae* f. *tridactyla* [ibid., v, p. 690], and *Uncinula prunulae* [ibid., i, p. 335] on the plum; *Sphaeroteca pannosa* f. *persicae* [ibid., vii, p. 123]

on the peach and apricot; *S. frugiperdae* [*S. humuli*] on the strawberry [ibid., vii, p. 491]; *S. moreae* on the gooseberry and certain species of currants; and *Phyllostinia corylea* on the hazelnut. The control measures to be applied against these diseases are indicated.

ABALDYS (F.). *Fytopathologické poznámky V.* [Phytopathological notes V.] — *Ochrana Rostlin*, ix, 5, pp. 108—128, 10 figs., 1929.
[German summary. Received December, 1930.]

[German summary.] Received December, 1920.
 The author states that, in consequence of an extremely hard winter followed by an exceptionally dry spring, the growth of most of the agricultural crops and other plants was considerably retarded in 1920 in Norway and their resistance to disease was much lowered. These conditions were responsible for several outbreaks of peculiar forms of galls and lattice pit [a description of which is given] in apples, the latter developed while the fruit was still on the tree, in contradistinction to the usual form which only appears in storage. Young trees appeared to be more susceptible to the trouble than older ones. The climatic extremes adversely affected vines, many of which, especially older plants grafted on American stocks, perished from (non-parasitic) apoplexy, and others from 'bacterial tuberculosis' caused by *Bacillus* [*Bacillus*] *tumefaciens*. They also intensified the symptoms of mosaic usually observed in various plants, especially in raspberries. Observations during 1920 on this last showed that the sharpness of the distinctions drawn by the author between the four virus diseases of the raspberry in a previous paper [R.A.M., vi, p. 333] greatly varied with the altitude of the station of growth of the host, and that all combinations of the symptoms of each type

frequently appeared on the same plant, this is considered to conflict with his former view of the existence of several types of raspberry mosaic. Severe mosaic was also observed on sweet peas (*Lathyrus odoratus*) (ibid., viii, p. 9) and on sugar and fodder beets; the interesting fact was noted that beets affected with mosaic appeared to be entirely immune from attacks of *Cercospora beticola* and rust (*Puccinia beticola*), both of which were otherwise very severe locally on those crops. Of recent years it has been observed that certain flowering plants, including *Paeonia*, *Dahlia*, *Begonia*, and *Pelunia*, are being increasingly attacked and killed by *Bact. tumefaciens*. In southern Bohemia *Bacillus carotovorus* was found in 1928 causing a heart rot of celery.

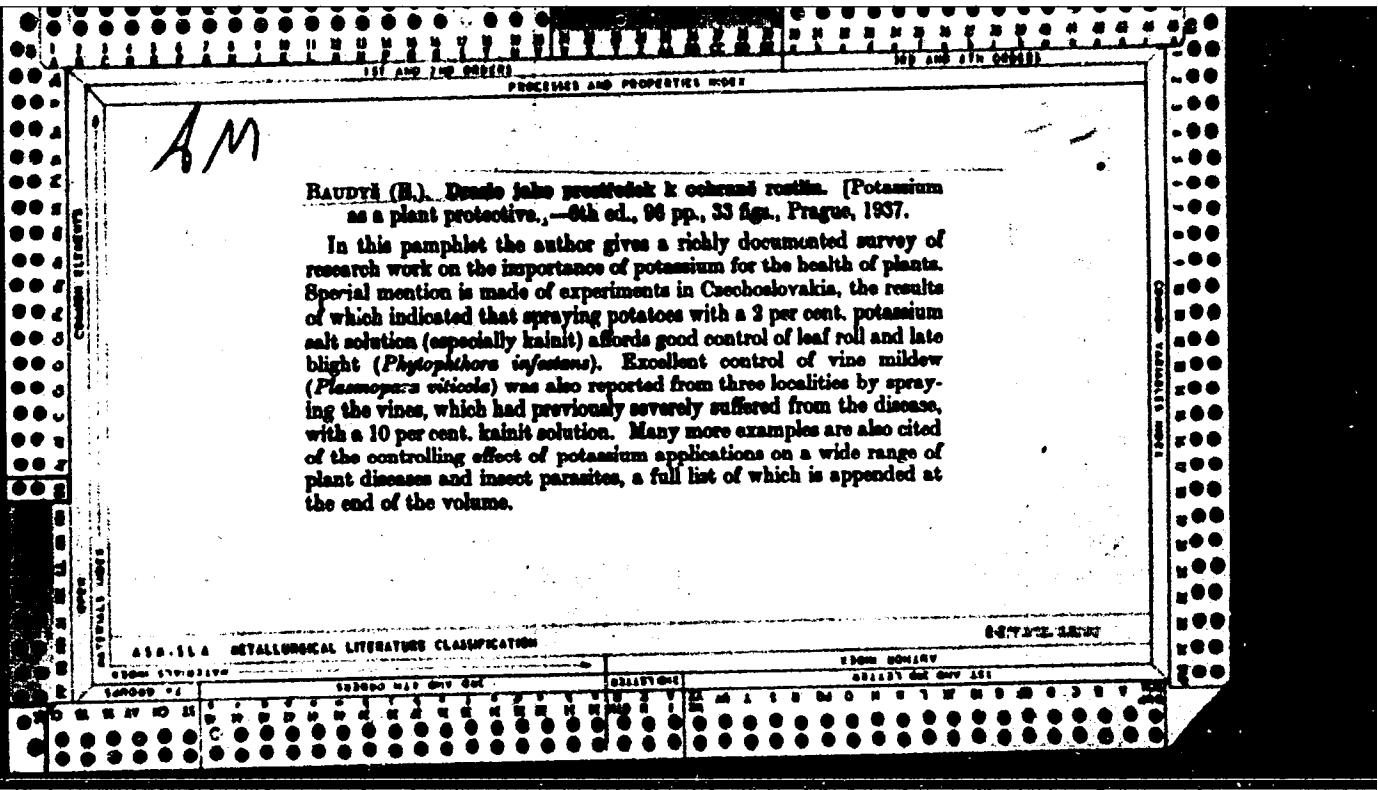

Walnut seedlings in nurseries were killed in large numbers by a blight associated with an yet unidentified species of bacteria and *Fusarium*, and infection experiments are in hand to establish which of these organisms is responsible for the disease.

Abstract : Galls caused by weevils in Czechoslovakia were surveyed in detail also using data from adjacent countries. The author's vast collection (more than 5300 specimens) formed the chief basis for the work. The feeding plants for each species were pointed out and their distribution in Czechoslovakia was reported in detail. Only a few of the numerous weevil species were found to form galls. -- D.P. "Glucose Metabolism in Cell Lines Adapted to Cold."

Prague, Ceskoslovenska Fisiologie, Vol 15, No 2, Feb 66, p 106

Abstract: From mammal cells L, HeLa and Detroit 6 lines with high resistance to cold (4°C) were obtained; their propagation at 30° - 36°C was very fast. All 3 lines decomposed glucose faster than controls; the levels of pyruvic and lactic acids were also lower than in controls. The cells used up more glucose without releasing more intermediate products; the experimental cells released more acid to the medium than control cells. It is possible that the strains resistant to cold stimulate cell oxidation and behave during adaptation to cold as complete animals. 1 figure, 1 Czech reference. Submitted at "16 Days of Physiology" at Kosice, 29 Sep 65.

Prague, Ceskoslovenska Fisiologie, Vol 15, No 2, Feb 66, pp 105-106

Abstract: Subcutaneous fibroblasts from mice were used to prepare a culture exposed repeatedly to cold. This results in replication without division of the cytoplasm, so-called endoreduplication, which was manifested after it was removed from the cold, during the first mitosis by the existence of diplochromosomes in cells. Endoreduplications were known previously to be due only to radiation effects. 4 Figures, 6 Western, 1 Czech reference. Submitted at "16 Days of Physiology" at Kosice, 29 Sep 65.

no. 51, 1965, 37-51TOPIC TAGS: antarctic climate; glaciology, ice, antarctic ice cap, ice cap mass
balance, ice cover surveying, radarranging, ice sampling

ABSTRACT: The problem of mass balance of the Antarctica ice cover is investigated by concentrating on the mass changes of the central part ice cap. Problem difficulties are due to absence of direct information, such as is available for the outer fringe zone, where the 20th century warming trend has caused observable ice retreats. The authors offer a method based upon three hydrodynamic equations of the ice flow, representing continuity and the two boundary conditions of mass transfer thru the upper and lower surfaces of the superglacier. A single integral equation is then derived, relating the velocities of the external and internal mass exchange with the velocity of mass change at a given point. It is noted that in the environment of Central Antarctica most of the equation's members can be neglected. The remaining essential quanti-

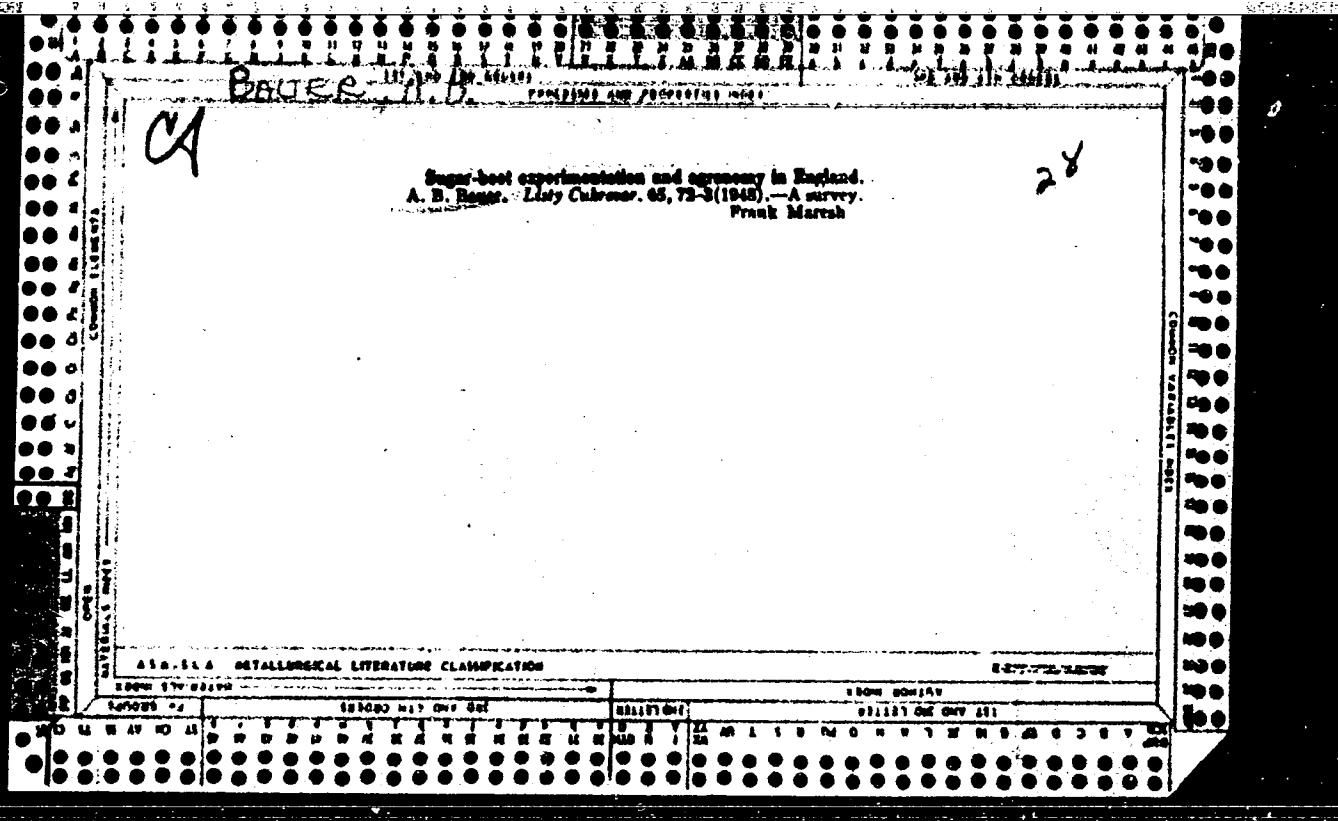

Card 1/2

ties: a - mass arrival velocity per unit of upper surface projection on the horizontal plane; $\rho(z,t)$ - ice density, as function of depth and time; $du(z)/dx - dv(z)/dy$ (with $u(z)$ and $v(z)$ - ice velocities along the X and Y axes at depth z); and their time derivatives, can be measured at the surface and extrapolated to depth on the basis of shallow borings. On the basis of the analysis and measurements made previously, a work plan has been formulated. Its main features were: precise radar range surveying of permanent 8 meter high markers defining pentagon nets at suitable stations; astro-orientation; 8" dia. firn samplings at low depths; and electric soundings for ice density. The expedition was conducted with the participation of a group of French scientists, including one of the present authors (Prof. A. Bauer). A description of the expedition's organization, a diary of operations and tables of some measurements related to the survey marker nets are given. The precision of distance measurement by special radar equipment was found to be good, with errors less than one part in a million. Measurement operations were found to be unimpeded by low blizzards, except for a single 12 hour interruption of radar signal passage. The results obtained and the established marker system should permit a satisfactory repetition of measurements in two years, as planned. The electrometric ice density determination method was found to be unsuitable in its present form. Orig. art. has 1 figure, 7 formulas and 5 tables.

Abstract : Fluorescent lamps of the same type still differ in color. To determine this sufficiently small difference a special objective instrument is proposed. The instrument employs a photocell with two filters. It is intended for the measurement of fluorescent tubes, in which the energy distribution in the spectrum of radiation from the fluorescent phosphor has two continuous bands. Data are given on the minimum noticeable difference between the colors of the two lamps, and also statistical data on the results of

TITLE: Method for increasing electric length of antennas

SOURCE: Vestnik svyazi, no. 12, 1965, 8-9

TOPIC TAGS: antenna, antenna engineering, medium frequency antenna, antenna mast, antenna power

ABSTRACT: To add the antifading feature to a vertical-mast medium-frequency antenna, it is recommended that a coiled piece of wire be connected to the antenna open end, thus increasing its electric length by very economical means. A numerical example shows that an antenna's ($\lambda = 300$ m) electric length of 27.5 m can easily be brought to 41.5 m, while both its radiation resistance and efficiency materially increase. The loading-coil height is only 1/7 to 1/5 that of an additional steel structure which would be required in order to obtain the same results. Orig. art. has: 2 figures and 6 formulas.

TITLE: Experiences made with the introduction of group technology

PERIODICAL: Strojirenská výroba, v. 9, no. 3, 1961, 115 - 119

TEXT: This article is based on dissertations of graduates of the Economics-Engineering Department of the CVUT Institute of Technology in Prague, and intends to inform workers of the machine-building industry on some experiences gained at the introduction of group technology according to S. P. Mitrofanov. This group technology simplifies the machining of parts with similar dimensions and was introduced on lathes of the "ČZNM" National Enterprise in Prague (producer of small series of ultra-heavy diesel engines) and the "MEOPTA" National Enterprise in Prague (producer of small series of microscopic and geodetic instruments and balances). The "ČZNM" Enterprise uses the group technology for machining of a total of 101 types of parts, distinguished into 6 groups: (1) flanges - 28 types of individual parts; (2) bevel gears - 6 types of parts; (3) cams and hubs - 22 types of parts; (4) shafts - 16 types of parts; (5) ring flanges - 17 types of parts; and (6) adapters - 12 types of parts. The unnecessary variety of dimensions of

parts could be standardized and complex parts were designed for which the group technology was established. Such a group machining program is a chart which contains all single parts of the group and all operations to be performed, but only those dimensions, to which a certain part should be machined, are plotted in pertinent columns, other columns are left blank. Parts selected at the "MEOPTA" Enterprise for group machining can be divided into 2 groups: (1) pinions - 10 types of individual parts; and (2) sleeves - 9 types of individual parts. The pinions (1st group) are made of "CSN 11 108" standard rods with diameters ranging from 5.5 - 9.0 mm, and are most economically machined on an "S 28" lathe with an "IKS 1" copying attachment. The copying is performed in three runs with a cutting speed of 23.5 m/min. The sleeves (2nd group) are standardized to 3 dimensions for internal and external recesses (0.5, 1.0 and 1.5 mm). Cutting tools were clamped either in the headstock and the copying support or in a special turret head, fastened in the tailstock. The economic evaluation showed, that the 2,395 working hours required by the conventional machining method could be reduced to 1,425 working hours, which means an overall saving of 40.5% and a 43.5% saving of original wages. The copying attachment paid for itself within 7 months. In the following, some experiences are listed, which were gathered during introduction of group machining on

turret lathes of the 2 above-listed plants, the Blanické strojírny-závod Konstrukta (Machine-Building Plant) in Prague and the TOS (Machine Tool Plant) in Hostivář. The economical evaluation of the group technology, introduced on automatically controlled lathes, resulted in a work-productivity increase of 17%. The total savings, achieved in the production of cams (103 assorted parts) amounted to 60,420 Czech Crowns. [Abstracter's note: period in which savings were made is not stated]. In addition to these savings, the described group technology also increases the quality level of products. In conclusion, the authors state that these are only the very first experiences, gathered with the S. P. Mitrofanov group technology, but the method will be further expanded and developed for the benefit of Czechoslovak machine-building industry. There are 10 figures.

"The Use of the Vacuum Extractor Instead of Forceps"

Warsaw, Polski Tygodnik Lekarski, Vol XVIII, No 7, 11 Feb 1963, pp 259-262

Abstract: [Author's English summary modified] The Vacuum Extractor was used instead of forceps in 42 cases of pathologic labor; the total number of deliveries in this period (1 Oct 1959- 31 Aug 1961) being 2846. The indications and the advantages of this safe method are discussed. The cases in which it may be used should be carefully chosen, however.

All the mothers and newborn babies delivered by this method were discharged 6 to 10 days after delivery, in good condition. The results of complex studies (inducing electroencephalic tracings) performed in 200 children aged 1 to 2 by Fulst and Holtorff are mentioned. 2 tables; 10 Western, 2 Eastern references;

BAUER, JAROSLAV

CZECH

Synthesis of 1-azadamantane. Rudolf Lukes, Vlastimil Gallk and Jaroslav Bauer. (Vysoká škola chem., Prague). Chem. Listy 58, 838-841. Collection Czechoslov. Chem. Commun. 19, 713-15 (1954) (in English). — Methylene (I) was oxidized to trimesic acid (II), the Et ester of which (III) was hydrogenated to *tert*-Et hexahydrotrimesate (IV). Reduction of IV with LiAlH₄ yielded 1,3,5-trimethylcyclohexane (V) which was transformed to 1,3,5-tris(bromoethyl)cyclohexane (VI). The action of VI with NH₃ gave 1-azadamantane (VII). Adding with efficient stirring during 30 min. at 98° a hot soln. of 100 g. KMnO₄ in 600 ml. H₂O to 12 ml. I and 20 ml. H₂O, refluxing the mixt. 2 hrs., destroying the excess KMnO₄ with MeOH, filtering the MnO₂, and acidifying the filtrate to Congo red with HCl gave 10 g. (48%) II, m. 280° (from H₂O). Refluxing 1 hr. a soln. of 10 g. II in 150 ml. abs. with HCl, evapg. the soln. *in vacuo*, and dilg. the residue with equal vol. H₂O gave 10.8 g. (73.6%) III, m. 135° (from EtOH). Hydrogenating 2 g. III in 10 ml. AcOH 20 hrs; over 0.4 g. PtO₂ gave, after vacuum evapn., 1.8 g. (91.8%) IV, m. 86.7°, *mp* 217-18°, *b.p.* 151°. Refluxing IV 3 hrs. with 18% HCl gave 97.5% hexahydrotrimesic acid, m. 216° (from H₂O). Adding a soln. of 1.3 g. IV in 15 ml. Et₂O to 0.8 g. LiAlH₄ in 100 ml. Et₂O, refluxing the mixt. 30 min., and decomposing the mixt. with 1 ml. water and 6 ml. 10% H₂SO₄, pouring off the ether layer, wash. the ppt. in the aq. layer with EtOH, evapg. the EtOH, and distg. the residue *in vacuo* gave 0.6 g. (69%) V, m. 102-3° (from dioxane), *b.p.* 175°. Heating 0.8 g. V 10 hrs. with 10 ml. 27% HBr in AcOH in a sealed tube on the steam-bath, dilg. the

(over)

REPRODUCED BY
KODAK SAFETY FILM

mixt. with H_2O , and extg. with $CHCl_3$ yielded 1.0 g. (86.5%)
VI, m. 86-7°. Heating 1.5 g. VI with 12 ml. 20% NH_3 in
 $MeOH$ in a sealed tube at 145°, neutralizing the mixt. to
Me orange, filtering the soln. with C, evapg. to dryness,
extg. the residue with abs. EtOH to remove NH_4Cl , evapg.
the alc. ext. to dryness, dissolving the residue in 2 ml. H_2O ,
treating the soln. with 5 g. p -Mc₆H₄SO₃Cl and, at 80°,
with 30 ml. 16% NaOH, steam distg. the soln., titrating
the distillate with 2N HCl, and evapg. the soln. of the
salt to dryness gave 14.2% HCl salt which was transformed
to the picrate of VII, m. 300-1° (from H_2O). Decomp. the
picrate with HCl, and liberating the base with NaOH yielded
VII, m. 257-8° (sealed capillary) (purified by sublimation).
A crystallographic investigation of VII was carried out by J.
B.

Crystallographic data of some organic compounds having higher symmetry. Jaroslav Bauer (Vysoká škola chem. technol., Prague). Československý chem. ročník, 1957, 145-65.—Crystallographic data on 1,3,5-triaminocyclohexane (I), 1-acetoxymazine (II), bicyclo[2.2.2]octene-7 (III), and 1-acetoxymethylcyclo[0.9.9]undecane bromide (IV) are summarized. I (prepd. by Lukes and Syhora, C.A. 47, 12393), m. 260°, d. 1.219, crystallizes in the cubic system in rhombic dodecahedrons (110), is isotropic in polarized light, has a space-centered lattice, const. $a = 7.33$ Å, no. of mol. in the cell $Z = 2$, shortest effective distance between 2 mol. centers 6.2 Å. Probable space group $\overline{F}3-1\bar{4}3m$. II (prepd. by Lukes, et al., C.A. 49, 9664), m. 257°, d. 1.122 (measured), 1.114 (calcd.), crystallizes in the cubic system in twin + and - tetrahedrons (111,111), is isotropic, has face-centered lattice, const. $a = 9.33$ Å, shortest effective distance of mol. centers 6.6 Å, probable space group $\overline{F}3-1\bar{4}3m$. III, m. 168-70°, d. 0.9641 (measured), 0.9628 (calcd.), crystallizes in the cubic system in octahedrons (111), is isotropic, has face-centered lattice, const. $a = 9.105$ Å, no. of mol. in the cell $Z = 4$, shortest effective distance 6.4 Å. Probable space group $\overline{O}-Pm\bar{3}m$. IV (prepd. by Šorm and Beránek, C.A. 49, 292c), m. above 350°, hexagonal system, (1010) and (0001), anisotropic, single axis, pos. optical character, refractive index $n_{\perp} = 1.668$, $n_{\parallel} = 1.664$, cleavability along 0001.
