TITLE: Investigation of climatic changes

B

SOURCE: Meteorologicke zpravy, no. 6, 1965, 158-161

TOPIC TAGS: weather forecasting, long range weather forecasting, climatic condition, solar activity

ABSTRACT: Short term, medium term, and long term meteorological forecasts are discussed. Differences between abnormal weather conditions and changes in local climate are evaluated. The methods for the investigation of changes in climate are described. The required series of observations, the relationship between various observatories and the theory of climatic changes are described. Individual steps in the investigation of climate variation are discussed; a special process for the investigation of the dynamics of the climate in Czechoslovakia is described. The application of statistical methods to the evaluation of the observed data, their comparison to meteorological elements found in the whole of Europe, and the influence of the solar activity upon the climate must always be considered. TITLE: Long-term variation in the pressure field<sup>12</sup> above Europe

B

SOURCE: Meteorologicke zpravy, no. 6, 1965, 167-169

TOPIC TAGS: atmospheric pressure, climatology, atmospheric circulation

ABSTRACT: Nonperiodic changes in pressure are considered to be an indication of the intensity of air circulation. The periodic nature of the time intervals of decreased and increased circulation in the Northern Hemisphere, and in Central Europe are discussed. Rhythms in the occurrence of the months with intensive air circulation in Europe are described. It seems that the periodic changes are repeated in a two year cycle. Orig. art. has: 3 figures. [JPRS]

AUTHOR: Bayer, M. Ya, Engineer. 334

TITLE: On the conformal method of profiling the blades of radial-axial turbines. (O konformnom metode profilirovaniya lopastey radialnoosevykh turbomashin.)

PERIODICAL: "Energomashinostroenie", (Power Machinery Construction), v. 3, 1957, No. 4, pp. 18 - 19, (U.S.S.R.)

ABSTRACT: Analytical expression of the curve of the conformal diagram, which represents a transformation of the Bauersfeld equation, proves the incompatibility of arbitrary configurations of the blade edges since this contradicts the original theoretical premises. The author claims, therefore, that the method of conformal mapping is inapplicable for profiling the blades of radial-axial turbines. In spite of the theoretically incorrect assumptions, it is possible, on the basis of numerous experimental results, to select the most suitable variant which will fully satisfy practical requirements. 1 diagram. 2 Russian references.

TITLE: Solubility of nitrogen in molten nickel and in alloys of nickel with chromium, molybdenum and tungsten

SOURCE: AN SSSR. Izvestiya. Metally, no. 4, 1965, 37-45

TOPIC TAGS: nitrogen, nickel, molten metal, nickel base alloy, chromium containing alloy, molybdenum containing alloy, tungsten containing alloy, solubility

ABSTRACT: The low solubility of nitrogen in molten nickel has caused discrepancies in the experimental data for this solubility in the literature. Since nitrogen is always present in metals and alloys, and data on its solubility and activity in molten metal are important for elimination of nitrogen from a melt (or in some cases for saturating a melt with nitrogen), the authors studied the solubility of nitrogen both in molten nickel and in binary nickel-based alloys containing additions of technically important elements. The experimental setup is described in detail. N-O nickel of 99.987% purity was used in the experiments. Provisions were made to keep experimental errors to a minimum. The results are tabulated and graphed. The

Card 1/4

I. 65050-65

ACCESSION NR: AP5021495

process for dissolution of nitrogen in nickel is given by the equation

where  $[\%N]$  is the concentration of nitrogen in the metal which is the equilibrium concentration at a given temperature with partial pressure of nitrogen in the gaseous phase  $P_{N_2}$ ;  $f_N$  is the activity factor which takes account of deviations of solutions of nitrogen in liquid metal from Henry's law. Mathematical analysis of the results of this study gives the following equation for the equilibrium constant of this reaction as a function of temperature:

$$\lg K = \lg[\%N] - \frac{3610}{T} - 0.973$$

$$\Delta F^\circ = 69000 + 18.6T, \text{ joules/g}\cdot\text{at}$$

$$(\Delta F^\circ = 16500 + 4.45T, \text{ cal/g}\cdot\text{at})$$

It was found that chromium, molybdenum and tungsten reduce the activity factor of nitrogen in nickel (see fig. 1 of the Enclosure). This is apparently due to the

Card 2/4

L 65050-65

ACCESSION NR: AP5021495

fact that these elements have more affinity for nitrogen than for nickel. The parameters of interaction for these elements are

$$e_N^{Cr} = -0.11, e_N^{Ni} = -0.04, e_N^{W} = -0.025$$

AUTHOR: Bayer, Ryszard

TITLE: A linear circuit for measuring amplitude ratios of two pulses

PERIODICAL: Nukleonika, v. 6, no. 11, 1961, 749 - 756

TEXT: The circuit was developed in order to analyze two incoming pulses according to their pulse-height ratio by converting it first into time so that a time of the flight analyzer could be used for sorting and displaying the spectrum. Utilizing the available time of the flight analyzer was considered to be more economical than building a special analyzer for the purpose. The conversion of the ratio of the two voltages into time was performed in linearly by the Miller effect of a pentode tube working in a monostable screen-coupled "phantastron" circuit. In such a circuit the input signals applied to the plate and the first grid of the pentode yield a pulse at the second grid, whose width is proportional to the ratio of the two input pulses. The performance of the linear converter is discussed in comparison with that of a logarithmic circuit, and the latter is

TITLE: A 10-mhz linear window amplifier 25

SOURCE: Nukleonika, v. 10, no. 12, 1965, 811-815

TOPIC TAGS: feedback amplifier, pulse generator

ABSTRACT: The amplifier system consists of an initial gain-control switch (100:1), a 10 MHz gain-of-four hundred amplifier with two feedback sections, a 0-30 volt discriminator (lower-level cutoff), a pulse lengthener, and a 2 MHz variable gain amplifier. The fast amplifier produces the required initial amplification of pulses which often includes a very large fraction of small, unwanted pulses. The threshold circuit (discriminator or "rug Sweeper") passes only the upper part of the larger pulses, the part that rises above the discriminator circuit. Having thus rejected the smaller pulses, the truncated larger pulses are lengthened and amplified. They are now suitable as input to an analyzer which views a selected segment of the overall pulse-height spectrum. The selected segment is controlled by discriminator and gain settings. The instability of the discriminator setting was corrected with the use of a precision pulse generator. The amplifier gain stability was within 1 percent per week. The overall amplifier linearity is 1 percent. Orig. art. has 6 figures.

TITLE: Coincidence circuit for x ray spectrometry

SOURCE: Nukleonika, v. 10, no. 12, 1965, 807-809

TOPIC TAGS: x ray spectrum, spectrometry, coincidence circuit

ABSTRACT: A 0.1 microsecond time resolution coincidence circuit is described, which consists of two parallel circuits that precede the coincidence function, and a pulse shaper and linear integrator (Cooke-Yarborough count rate circuit) with ranges of 1, 10, 100, 1000, 10,000, and 1000 counts per second. Each of the two parallel circuits preceding the coincidence function has a pulse-height discriminator, a univibrator type delay generator (relative delay equal 2 microseconds), and a pulse shaper. A plot of coincidence counts versus relative delay time yields flat-topped "curve" with a full width at half maximum of  $2\tau$  equal 0.2 microseconds. The work was carried out at the Institute of Physics, PAN. Orig. art. has: 3 figures.

ABSTRACT: Single bremsstrahlung in high electron collisions is considered. The angular distribution and spectrum of the emitted photons in the center of mass system and the laboratory system are calculated. Radiation due to the incident particle and recoil particle is considered in the 1. s. case. The classical current and Weizsacker—Williams methods are analyzed and it is shown that the latter method is not valid for calculating the spectrum of photons emitted by recoil

TITLE: Photon emission during muon pair production by electron-positron collision

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 48, no. 3, 1965, 946-951

TOPIC TAGS: photon emission, muon pair production, electron positron collision, colliding beam experiment, differential cross section, total cross section

ABSTRACT: The paper deals with the emission of a photon in the production of a muon pair by electron-positron collision ( $e^+ + e^- \rightarrow \mu^+ + \mu^- + \gamma$ ). Such processes are expected to be important in the near future in colliding beam experiments. A method is proposed for calculating in a simple manner the total cross section of this process, integrated over the final muon states. The idea of the method is to integrate the separate parts of the diagrams by using the properties of relativistic, gauge, and charge invariants. It is then unnecessary to make the very cumbersome calculation of the differential cross section, since the traces of the electron and muon parts of the diagrams are integrated directly. This is a universal

Card 1/2

L 47364-65

ACCESSION NR: AP5008755

method and can be used for the calculation of the cross section for various processes of the same type. The exact formula is then derived for the total cross section of emission of a photon in the production of a muon pair. The formula is then analyzed and the behavior of the cross section determined for two limiting cases, near and far from the threshold. The difference between the behavior of the obtained formulas and those for bremsstrahlung in electron scattering is pointed out. "The authors thank V. M. Galitskiy for a discussion." TITLE: Polarization effects in the production of particles in colliding beam experiments <sup>19</sup>

SOURCE: AN SSSR. Doklady, v. 161, no. 1, 1965, 74-77

TOPIC TAGS: colliding beam experiment, electron polarization, electron positron annihilation, pair production

ABSTRACT: To estimate the influence of electron polarization on the fundamental two-particle processes occurring during annihilation of an electron-positron pair, the authors calculated the cross sections for the production of pairs of pions, muons, nucleons, and vectors by polarized electrons and positrons. The polarization is produced when the electrons move in a magnetic field and radiate. The calculations show that polarization of the initial electrons and positrons causes the cross sections of two-particle annihilation to be appreciably deformed compared with the cross sections of the process for nonpolarized particles. Such a deformation may be taken into account in experiments with colliding beams. On the

Card 1/2

L 46327-65

ACCESSION NR: AP5009215

other hand, experiments with initially polarized particles yield no new information on the form factors, compared with experiments with unpolarized particles. To obtain new information on the form factors it is essential to measure the polarization of the final particles. This report was presented by G. I. Budker. Orig. art. has: 12 formulas.

TOPIC TAGS: electron positron annihilation, photon emission, emission cross section, integral cross section, form factor

ABSTRACT: The authors use a procedure proposed in an earlier paper (ZhETF v. 48, 946, 1965) to calculate the cross sections for the emission of a photon in several annihilation processes. The first process investigated is the formation of a pair of scalar particles upon annihilation of an electron-positron pair. To take into account the influence of strong interactions, form factors of the final particles are introduced and it is shown that by making use of relativistic, gauge, and charge invariance properties, it is possible, by summing over the spins of the final particles, to write down a universal formula for the integral cross section of the emission by the initial particles. To take account of the influence of strong interaction on the emission by the final particles, the contributions of Compton-type diagrams are taken into account. This is done by expanding the am-

Card 1/2

2

plitude of the photon emission in a series and retaining the first two terms. A universal formula is written out for the first term and the method of F. Low (Phys. Rev. v. 110, 974, 1958) is used to calculate the second term. The emission produced upon creation of a pair of pions is calculated as an example. It is shown that in all the cross sections in question the interference term vanishes. "The authors thank Y. N. Galitskiy for numerous discussions." Orig. art. has: 2 figures and 58 formulas.

TITLE: Possible verification of nonconservation of time parity in colliding beam experiments

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki. Pis'ma v redaktsiyu. (Prilozheniye), v. 2, no. 7, 1965, 330-333

TOPIC TAGS: parity principle, electron collision, collision cross section, electron positron pair

ABSTRACT: It is pointed out that the hypothesis of J. Bernstein, G. Feinberg, and T. D. Lee (Preprint, 1965) that electromagnetic interactions of strongly interacting particles are C- and T(CP)-invariant can be verified in a series of experiments with colliding positron-electron beams, for which installations are now under construction in several laboratories. It is shown that although in the single photon approximation C-invariance forbids many processes i: the annihilation of a positron-electron pair into a pair of strongly interacting particles, the processes

$$\begin{aligned} \text{a)} \quad e^+ + e^- &\rightarrow \gamma \rightarrow \pi^0 + \eta^0, \\ \text{c)} \quad e^+ + e^- &\rightarrow \gamma \rightarrow \omega^0 + \rho^0, \end{aligned}$$

$$\begin{aligned} \text{b)} \quad e^+ + e^- &\rightarrow \gamma \rightarrow \phi^0 + \rho^0, \\ \text{d)} \quad e^+ + e^- &\rightarrow \gamma \rightarrow \phi^0 + \omega^0, \end{aligned}$$

can occur if the transition current of the strongly interacting particles contains a C-odd term. The most realistic in colliding-beam experiments would apparently be an investigation of the asymmetries of the products of reactions of the type

In the case of reaction (e), which was considered in detail by the author earlier (with V. A. Khoze, ZhETF v. 48, 1708, 1965), the cross section of the process has a peak near the  $\rho$ -meson peak ( $E = 380$  Mev), where it is sufficiently large to be measurable with modern techniques, but the main difficulty lies apparently in the identification of the events. Author is deeply grateful to V. M. Galitskiy, V. A. Sidorov, and A. N. Skrinskiy for a discussion, and to B. M. Pontecorvo for acquainting him with the work of Lee and his co-workers. TITLE: Quantum depolarization of electrons in a magnetic field

SOURCE: AN SSSR. Doklady, v. 165, no. 4, 1965, 783-785

TOPIC TAGS: depolarization, cyclic acceleration, electron polarization

ABSTRACT: The authors show that depolarization of electrons and positrons in modern storage rings can be caused not only by resonance due to radial and azimuthal components of the magnetic field on the particle trajectories, but also by the quantum nature of the radiation. The latter depolarization occurs also only in the presence of perturbing radial and azimuthal field components, but is produced by harmonics which cannot be eliminated by suitable choice of the energy. Calculations show that the effect depends very strongly on the particle energy and on the number of closest harmonic of the radiation, the distance between the harmonic and the resonance, and on the vertical displacement of the particle in the orbit. It is shown by way of an example that in a typical storage ring the characteristic depolarization time is one order of magnitude lower than the polarization time, so that in this case the beam can become readily depolarized unless special measures are adopted to maintain the beam polarization. This report was presented by Academician G. I. Budker. Orig. art. has: 17 formulas.

TITLE: Electromagnetic particle pair production

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 50, no. 1, 1966, 156-168

TOPIC TAGS: pair production, particle collision, photon emission, fermion, collision cross section, electromagnetic interaction, nuclear spin, charged particle, differential cross section, integral cross section, quantum electrodynamics, bremsstrahlung

ABSTRACT: This is a continuation of a series of earlier papers (ZhETF v. 48, 1708, 1965 and elsewhere) dealing with bremsstrahlung occurring upon collision of two charged particles, and the emission of a photon following two-particle annihilation of a pair of particles. The method used in these investigations consisted of integrating individual parts of the diagrams and using the properties of relativistic, gauge, and charge invariance. In the present article this method is used to calculate the cross sections for electromagnetic pair production under the simplifying assumption that all the charged particles are distinguishable.

Card 1/2

L 22136-66

ACC NR: AF6004934

The cross sections for the creation of pairs of fermions with spin  $1/2$  or of scalar particles upon collision of a photon with a charged particle are calculated. Exact expressions are obtained for the differential cross sections in terms of the invariant mass of the pair of charged particles. The obtained cross sections are discussed from the point of view of the study of the form factors of the particles and the check on the validity of quantum electrodynamics at small distances. This is followed by an analysis of the annihilation of a pair of particles into two pairs of charged particles. The exact value of the differential cross section is obtained in terms of the invariant masses of the produced pairs, and the properties of these cross sections are discussed. Approximate expressions are also obtained for the integral cross section. The calculation takes into account the recoil and the contribution of the dispersion, and the Compton tensor of the fourth rank is integrated over the final states of the fermion pair. Orig. art. has: 4 figures and 3 formulas.

TOPIC TAGS: depolarization, electron polarization, quantum resonance  
phenomenon, transverse magnetic field, circular accelerator.

ABSTRACT: The authors show by theoretical calculation that the polariza-  
tion of electrons and positrons which they acquire in storage rings may  
be lost not only as a result of depolarizing resonances due to the  
radial and azimuthal components of the magnetic field on the particle  
trajectory, but also under the influence of the quantum character of the  
radiation. The quantum depolarization, like the resonance depolariza-  
tion, is also realized only in the presence of perturbing radial and  
azimuthal components of the magnetic field, but the satisfaction of  
resonance conditions is not essential in the quantum case. The resonance

Card 1/2

L 29295-66

ACC NR: AT6012262

required for the depolarization is produced in the quantum case by the Fourier components of the energy jumps connected with the quantum character of the radiation. Although this quantum depolarization, unlike the resonance depolarization, cannot be reduced by suitable choice of the particle energy, it can be reduced by minimizing the magnetic-field perturbations. Estimates for typical storage ring parameters show that the possible depolarization time (in the case of a 6 Bev storage ring with field  $8 \times 10^3$  Oe) can reach 25 seconds as against a polarization time of 190 seconds. TITLE: Emission of two photons in a specified angle during electron collisions

SOURCE: Zh eksper i teor fiz, v. 50, no. 6, 1966, 1611-1616

TOPIC TAGS: photon emission, electron collision, radiation detector, scattering cross section

ABSTRACT: This is a continuation of earlier work by one of the authors (Bayer, with V. M. Galitskiy, ZhETF Pis'ma v. 2, 259, 1965 and earlier) dealing with the emission of two photons of arbitrary energy as a result of electron collisions. In view of the great interest that attaches to this process in connection with colliding-beam experiments, and in view of the fact that earlier calculations were based on the assumption that the angular dimensions of the photon detectors greatly exceed the characteristic emission angle, the authors calculate in this article the cross section for the emission of two photons into a specified angle, which is shown to be only a fraction of the cross section of the radiation integrated over all the angles. The final expression, obtained by a combination of analytic and computer techniques, is in the form of a polynomial in the powers of the frequencies of the two photons. The numerical values of the coefficients of the powers of the frequencies are obtained in the case when the detector dimensions are of the order of magnitude of the characteristic

Card 1/2

L 41742-66

ACC NR: AR6020217

3

emission angle. An analytic expression for the cross section is obtained when the detector dimensions are much larger than the characteristic angle. The results of this analytic expression agree well with the numerical calculations. The authors thank A. P. Omuchin for a discussion of questions connected with the experiment, and G. I. Rusova and E. Z. Borovskaya for help with the numerical calculations. Orig. art. has: 1 figure, 14 formulas, and 2 tables.

TITLE: Practical tackles for the assembly of precast reinforced concrete constructions. (Ratsional'nye prisposobleniya dlya montazha sbornykh zhelezobetonnykh konstruktsiy).

PERIODICAL: "Mekhanizatsiya Stroitel'stva" (Mechanisation of Construction), 1957, Vol.14, No.5, pp.23-29 (USSR).

ABSTRACT: According to the time-studies of the YuzhNIIMinmetallurg-khimstroy (ЮЖНИИМИНМЕТАЛЛУРГИХИМСТРОИ) the assembly of one column of 12 t weight, 8 - 12 m high, takes 30 - 50 min. and 5 - 6 operatives are required. The above column can be placed in position in 5 - 10 min. by using the described and illustrated tackle which is shaped like an elongated "U". This lifting arrangement comprises a pivot which can be positioned along the arms. It is widely used in the East German Republic for lifting 10 - 20 t. heavy columns. The advantages lie in the ease of lifting from the horizontal position and that the column is in a vertical position during the jointing (Fig.1). Fig.2 illustrates the process of securing the upper part of a suspended column whilst the lower part is correctly positioned on the head of the lower column. The tackle was designed by I.K.Kovtun, an assembly operative of the Glavmosstroy factory. For

Card 1/6

Practical tackles for the assembly of precast reinforced concrete constructions. (Cont.)

100-5-8/10

this operation the head of the lower column is provided with steel square sleeve with 8 short steel rods welded to the same which serve as positioning guides for the base of the upper column. The suspended top column is provided with a sleeve formed of angle-irons to which 4 cables with rectifying screws are attached. Fig.3 indicates an effective arrangement of the "montage" beams. Two-arm double-lifting hooks (used in East Germany) can also be used for assembling small partitions and panels. This comprises a ring which is attached to the hook of the crane. Two ropes ending in hooks are attached. A "U" shaped loop is formed. The advantage lies in the small weight, low cost and universal use.

Device for the Assembly of Large Wall Panels: (Fig.4)

This comprises 3 joists: the top joist is fixed in a horizontal position through 2 loops and the cable of the lifting ring. On both ends of this joist are 2 freely hinged steel joists. This American device is used for lifting medium sized panels from the horizontal to the vertical position.

Balancing Traverse: (Fig.5)

Card 2/6

This is used for the assembly of wall panels and beams and consists of rolled steel joists with holes drilled along the

Practical tackles for the assembly of precast reinforced concrete constructions. (Cont.) 100-5-8/10

web. An attachment for suspension from the crane is fixed through the centre hole. Cables with lifting hooks are fixed on both ends. It is used for lifting panels with varying centres of gravity. The holes in the horizontal joist are used for adjusting the position of the middle hanger to suit the centres of gravity of various panels.

Lifting Device: (Fig.6)

Used abroad for lifting large wall panels. It comprises 2 frames which are fixed together with horizontal members. There are 2 base cantilevered supports and 2 pairs of horizontal gripping arms. The slabs lie in a vertical position and the frame can be used as a scaffold for welding and fixing.

Self-Balancing Lifting Device: (Fig.7)

This comprises a horizontal beam with a triangular welded plate with a centre lifting hole. Both ends of the beam are perforated and the holes are interconnected. A simple pulley arrangement is fixed through the holes and the cable running over the pulley has rings attached to both ends. This is a Canadian invention, the advantage of the device consisting in the self-balancing of the load in any required position.

Card 3/6

Practical tackles for the assembly of precast reinforced concrete constructions. (Cont.) 100-5-8/10

Tube-Lifting Device: (Fig.8)

2 steel channels are suspended on 2 cables, the channels being provided with 2 freely fixed loops which secure the lifted tube. This is used for reinforced concrete tubes (diameter 300 - 600 mm) of up to 2 t weight.

Device for Lifting Reinforced Concrete Tubes: (Fig.9)

Tubes of 900 - 1500 mm diameter, 1-1.35 m long and up to 2 t in weight can be lifted by this device. It comprises a clamp which is suspended from a cable. The tubes are hooked at the ends and a safe grip is obtained by lifting the weight.

Implement for Lifting Concrete Piles: (Fig.10)

The piles can be 8 - 11 m long and of 3.5 t weight. It comprises 2 steel channels which are welded together. It has 2 lifting cables which terminate in hooks which engage the eye concreted into the pile. 2 lifting rods are secured to the top of the channel which are joined in a ring so that the implement can be lifted by a crane.

Universal Lifting Tackle: (Fig.11)

Card 4/6 This was designed by S.N.Arsen'ev and is manufactured in the Mosgrazhdamglezhilstroy of Glavmostroy. It serves for the

Practical tackles for the assembly of precast reinforced concrete constructions. (Cont.) 100-5-8/10

assembly of large building construction units. It consists of a suspendable steel joist with 2 cables (4.6 m long) with attached steel rings at 1.2 m centres.

Figure 12:

This illustrates an ancillary attachment to the previous tackle for lifting large loads.

Figure 13:

This shows the universal tackle with the special attachment and the way of lifting large slabs in the horizontal position.

Figure 14:

Illustrates the above tackle and the way of lifting a precast concrete flight of stairs.

Implement for Lifting and Assembling Reinforced Concrete Slabs up to 4 tons: (Fig.15)

This comprises a horizontal steel consisting of 2 channels separated by a space in which 2 clamps are fixed which can be adjusted. These clamps perform the lifting.

Implement for Lifting "Collector" Plate: (Fig.16)

The rectangular plate weighs 27 tons. The implement has 4 steel cables of 15.5 m diameter which terminate in lifting

Jerie, Jan, ed., Engineer, Doctor, Corresponding Member of the Czechoslovak Academy of Sciences

Základní problémy ve stavbě spalovacíh turbin (Basic Problems in the Construction of Gas Turbines [collection of articles]). Prague, Nakl. ČAV, 1962. 627 p. 1600 copies printed.

Sponsoring Agency: Československá akademie věd.

Ed. of Publishing House: Marie Moravcová; Tech. Ed.: František Kondický.

PURPOSE: The book is intended to familiarize turbine designers with recent developments in the design of gas turbines and to present some research results which may be helpful in designing more efficient turbines.

COVERAGE: The book comprises articles by leading Czechoslovak turbine experts on thermodynamic cycles, flow research in turbine components,

ORIG. PUB. : Koza i obuca, 1958, 7, No 12, 449-453

ABSTRACT : Based on many years' experience the results pertaining to the preservation of hides, employing salt to which antibiotics are added, are presented. This method results in the salt economy up to 50% with the improvement of physico-chemical properties of finished leather.

AUTHOR: Bayer, Z., Engineer

TITLE: Thermodynamic characteristics of gas turbines with blades cooled by air

PERIODICAL: Strojirenství, 1961, Vol.11, No.10, pp.723-730

TEXT: The purpose of the article is to assess the combined effect of increased working temperature and the consequent necessity of cooling and aims at optimal overall efficiency. Calculations refer to cooling by air, using data in literature, but for future projects the author suggests steam as the cooling medium. At first, a schematic description is given of a single cycle gas turbine with an open loop cooling system. While it is recognised that in any particular case the lowest price per kWh should be the deciding factor, in the absence of the necessary data, only the overall thermal efficiency, the specific performance and the pressure ratio of the cycle were taken into consideration for arriving at an optimum solution. The author differentiates between two types of losses due to cooling: firstly, the temperature of the working medium will drop faster than without

E197/E535

cooling; secondly, power is needed to provide cooling. The first is called thermodynamic loss, the second circulation loss. Losses due to a worsening of aerodynamic conditions are included for calculation purposes in the above two. The original analysis of the author is given in a works report (Ref.2: Zpráva ÚVS-ČSAV, No.113-61) from which abridged fragments are quoted in the article. Thermal losses in the cooling channels are calculated from known heat transfer equations and the amount of thermodynamic losses are discussed with reference to literature. It is stated that those calculated by the reheat factor appear to be too low and that substantial differences exist between the results obtained by using various assumptions but, up to 1200°C, the differences are comparatively small. The author states that circulation losses are difficult to express by formulae. However, from considerations of geometry, the ratio of length to radius of channels is more favourable for large turbines than for small ones and the losses would be proportionally smaller in the former. In the numerical evaluation the polytropical efficiency of expansion and compression was taken as 0.88, the useful work per step as 40 kcal/kg, the

inlet temperature of cooling air as  $100^{\circ}\text{C}$ , the temperature at the tip of the blade as  $800^{\circ}\text{C}$  and at the root as  $630^{\circ}\text{C}$ . Diagrams are plotted in the paper for single cycles and these deal with the following: heat transferred to the cooling air dependent on maximum temperature of the cycle and on pressure ratio; thermodynamic losses which appear independent of pressure; circulating losses which increase both with temperature and with the pressure ratio; the ratio of circulation losses to thermodynamic losses; the sum of circulation loss and thermodynamic loss in relation to heat transferred; the amount of air needed, which appears excessive over  $1100^{\circ}\text{C}$ , and the dependence of thermal efficiency on pressure ratio for temperatures between  $600^{\circ}\text{C}$  and  $1350^{\circ}\text{C}$ . The article contains plots of the thermal efficiencies of various combinations of cycles, dependent on maximum temperature and on pressure ratios. In conclusion, the author states that for high specific loads the thermal losses due to cooling are not too serious. Above about  $1100^{\circ}\text{C}$  circulation losses will rise faster than thermodynamic losses. For best overall thermal efficiency the temperature should be about  $1200^{\circ}\text{C}$ , but there will be only a 0.5% gain over about  $1100^{\circ}\text{C}$ . On the whole, in the range from 6 to 25 MW a thermal

efficiency of 33 to 36% is obtainable, amounting to a specific performance of 230 to 340 kW/kg/s, equivalent to an air consumption of 16 to 11 kg/kWh. In comparison with an inlet temperature of 700°C the specific performance would now be doubled. The author attaches significance to the fact that actual measurements yielded a performance as calculated by assuming that  $c_p$  is constant. Since  $c_p$  cannot be constant, the author suggests further investigation into the cause of concordance and believe that research in that direction would be of practical importance. Finally, the author advocates the use of water, respectively water transformed into steam as a means of cooling, since steam has better heat transfer characteristics than air and would substantially reduce circulation losses. A disadvantage would be that the steam used would have to be free of impurities. There are 13 figures and 18 references: 6 Czech, 4 Soviet and 8 non-Soviet-bloc.
