TITLE: Results of the third All-Union conference on automation and mechanization of major rubber production processes

PERIODICAL: Kauchuk i resina, no. 1, 1963, 59 - 60

TEXT: The conference took place in Dnepropetrovsk from October 2 - 6, 1962. It was organized by the Central and Dnepropetrovsk Regional Administration of the All-Union Chemical Association BXO(VKhD) im. Mendeleyev; the Dnepropetrovsk Chemico-Technical Institute, im. F. E. Dzerzhinsky and the Dnepropetrovsk Tire Plant. 62 organizations were represented including 9 tire plants, 12 commercial rubber institutes, 5 rubber footwear plants, 3 recovery plants, 5 cable and 2 mechanical plants, 4 synthetic leather plants, 9 designing organizations, 7 scientific research institutes, 3 higher schools of learning, representatives of the State Committee of the USSR Council of Ministers on Chemistry, the State Economic Council, State Plan of the RSFSR, USSR, Ukr.sovmarkhоз, etc. 24 papers were read on major problems of mechanization and automation of the tire industry. Some of

the papers were: 1) B.I. Andrashnikov (top specialist on automation at the Rezino-proyekt) - "Principle and Constructive Stations for Mechanization and Automation of the Major Technical Processes at the Volga Tire Plant". 2) A. P. Pukhov, NIIISHP (NIIShp) - on the processing principles in vulcanizing of casings using computing machines. 3) Employees of the Dnepropetrovsk Tire Plant: a) T. A. Mayborod - on programming and automation control of raw materials, semi-finished products and finished product handling; b) V. A. Vasilenko - on the introduction of conveyor systems for the production of rubber mixes; c) Kh. N. Boredyshina - on the technology features of rubber mixtures production at the DTP; d) L. L. Osokin - on cord processing using a Z-type calander line; e) N. T. Yarovaya - on developing vulcanizing conditions for automobile and agricultural casings in formators-vulcanizers. 4) V. E. Vaysfel'd ("Krasnyy Bogatyr'" Plant) - on the organization of mechanized conveyor lines for the production of rubber footwear. 5) N. A. Rogov (Mogilev Recovery Plant) - submitted data on mechanization of recovery production. 6) Representatives of the Kursk Commercial Rubber Institute and the Kalin in Synthetic Leather Combine - on mechanizing the production of commercial rubber articles and automation and mechanization of the major production processes of synthetic leather. 7) G. A. Blokh (Dnepropetrovsk Chemico-Technical Institute) - on the application of ionizing radiation in the rubber industry; the use of

isotopes in the construction of monitoring and measuring units. 8) N. G. Bekin (Yaroslavl' Institute of Technology) - on calandering processes investigation and an instrument for the continuous checking of rubber mix pressure within the zone of deformation. 9) M. A. Polyak, same institute-on the cooperation of the Yaroslavl' Institute of Technology and the Yaroslavl' Tire Plant for modernizing the PC-2 (RS-2) rubber mixer and strengthening the production process of rubber mixes. 10) M. K. Mil'vidskiy (NIIRP) - on the investigation of thrust forces, occurring in the forming, vulcanizing and cooling of formed articles from hard rubber mixes, and on force calculations of lock press-forms. 11) B. K. Gor'kayev (Leningrad Tire Plant) - on mechanizing transportation and storage of tires in the finished products warehouse. 12) L. A. Knyaz'kov (Yaroslavl' branch of the Rezinoproyekt) - on designing a unit for cutting sprayed apparatus. 13) S. N. Rozhdestvenskiy (Yaroslavl' branch of the Rezinoproyekt) - on a unit for producing a non-formed foam-rubber plate. 14) I. Z. Lisogurskiy (Yaroslavl' Tire Plant) - on the stepping up of tire production and introduction of new tire models. 15) I. Ya. Dashevskiy (Dnepropetrovsk Tire Plant) - on special work features of equipment at the plant and the necessity of spreading the experiences of the Dnepropetrovsk Tire Plant to other plants. The conference called upon the State Chemical

Committee to organize a summary of Dnepropetrovsk Tire Plant technology results, pertaining particularly to automatic systems. Shortcomings in planning, research and information service centers were emphasized. A special activity group at the Rezinoprojekt was asked to be formed, which would submit yearly plans and results of experiments and designing on mechanization and automation. The need for mass production of the P (R) and PC (RS) tires was emphasized.

TITLE: Rubbers reinforced with organosilica

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 24 (II), 1962, 929,  
abstract 24P815 (Izv. vyssh. uchebn. zavedeniy. Tekhnol.  
legk. prom-sti, no. 2, 1962, 60-67)

TEXT: This is a study of how organo-silicas whose surfaces contain chemically bound organic radicals (ether, propyl, allyl, vinyl) affect the physico-mechanical properties of (NH-26 (SKN-26), (KU-40 (SKN-40), and (KE-30 (SKS-30) rubbers. Powdered silica gel containing organic radicals on the surface affects the physico-mechanical properties (tensile strength, moduli, etc. increase) of rubber considerably. The authors assume that the chemism of rubber solidification by organosilica is characterized by a reaction between the organosilica of organic radicals and the rubber molecules yielding complex vulcanization structures. The filler is chemically bound to the polymer either directly or via sulfide bonds.

TITLE: The radiation vulcanization of rubbers and reclaimed rubbers together with plastics

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 4, 1963, 648 - 649, abstract 4T349 (Kozhevenno-obuvn. prom-st', no. 5, 1962, 17 - 20)

TEXT: The effects of exposure to radiation were studied on the physical, mechanical and chemical properties of the following combined systems of polymers: rubber CKC-30 (SKS-30), CKG (SKB), HK(NK) - thermoplastics (low and high molecular-weight polyethylene, and polystyrene); ratios of thermoplastics to rubber of 0 - 100 % were used. The radiation dose ( $Co^{60}$ ) was 1 - 100 Mrad. The plasticity, hardness, wear-resistance, strength, percentage elongation, permanent set etc. were determined, and

Card 1/2

The radiation vulcanization of ...

S/081/63/000/004/049/051  
B156/B180

plotted versus temperature in the 40 - 200°C range. The effect of irradiation on mixtures of rubbers with polyethylene or polystyrene is that cross-linking occurs between the two polymers, to form substances with valuable physical and mechanical properties: the plasticity is greatly reduced, while the strength, wear-resistance and heat-resistance are improved. Abstracter's note: Complete translation.

TITLE: The effect of sulfur, contained in Omsk furnace carbon black, on the vulcanization kinetics of butadiene-styrene rubber, CKC -30 APM (SKS-30 ARM)

PERIODICAL: Kauchuk i rezina, no. 2, 1963, 15 - 17

TEXT: Soviet active furnace carbon black, ПМ-70 (PM-70), produced at the Omsk Carbon Black Plant from liquid raw material, qualifies as a ХАФ (KhAF) carbon black. It has, however, a high sulfur content (between 0.66 and 1.1%). The effect of the sulfur on the vulcanization kinetics of SKS-30 ARM and on the physico-mechanical properties of its vulcanizates was investigated. The mix had the following composition (in w.p.): SKS-30ARM - 100, rubrax - 5, stearin - 2, zinc oxide - 5, altax - 0.6, ДФГ (DRG) - 0.76, sulfur - 2, carbon black - 50. Data obtained showed that with an increase in the free sulfur content of the carbon black, the tensile properties of the vulcanizates increased and the vulcanization optimum is reached sooner. The vulcanizates containing Omsk carbon

Card 1/2

S/138/63/000/002/003/007  
A051/A126

The effect of sulfur, contained in Omsk ....

black showed a tensility higher by 25 - 37% as compared to the vulcanizates of the control batch. A reduction in the sulfur dosage by 25 - 40% leads to a drop in the rate of vulcanization since the bound sulfur requires time to dissociate itself from the carbon black structure and to form sulfur fragments which, in turn, actively participate in the chemical reactions of vulcanization. The altax and DFG contents in the Omsk carbon black may be reduced by no more than 35 - 40% without sharply reducing the rate of vulcanization and the physico-mechanical properties of the vulcanizates. Tests with radioactive sulfur showed that the sulfur contained in the Omsk carbon black participates in the reaction of sulfur atom substitution, is mobile, and takes part in the vulcanization reaction. Transverse bond formation due to the presence of sulfur proved further that the latter plays an active part in the structurizing and vulcanization reactions. The sulfur bound to the carbon black may possibly react with the molecular chains of the rubber forming a single space structure. Therefore, the use of the PM-70 requires additional correction of the vulcanizing systems in the compositions of the rubber mixes. There are 4 tables and 3 figures.

TITLE: Acceleration of vulcanization by tetramethylthiurammonosulfide

SOURCE: Kauchuk i rezina, no. 5, 1963, 24-27

TOPIC TAGS: vulcanization, acceleration of vulcanization, thiuram, thermal dissociation, free radical

ABSTRACT: The objective of the investigation was to study the kinetics of rubber vulcanization in the presence of tetramethylthiurammonosulfide (Unads) in comparison with such popular accelerators as Tuads, Altax, Captax, diphenyl-guanidine (DPG), Zimate, and Santocure. The vulcanization of natural rubber was conducted with 0.2-1.5% of Unads at 140C, and that of butyl rubber with 1.3%, the percentage of the other accelerators being 0.7% for the former and 1.3 for the latter. A study of the modulus taken at 10- to 20-minute intervals showed that in the presence of Unads the space lattice of the natural rubber vulcanizate was formed during the first 10 minutes, with the optimal concen-

Card 1/2

L 12685-63  
ACCESSION NR.: AP3001595

tration for Unads being 0.8% by weight, with little destruction during the following 50 minutes, while subsequent heating caused a drastic lowering of the modulus and resistance to tear. Vulcanization with Zimate gave a maximum modulus within 5-10 minutes, Santocure within 30 minutes, and Captax within 40 minutes, subsequent heating causing destruction of the vulcanization lattice. The acceleration of vulcanization by Unads is linked by the authors with the potential formation of free radicals. The vulcanization tests with Unada were conducted by V. Antonenko, L. Drozd, and L. Kachanova. Orig. art. has: 3 formulas and 3 charts.

EFFECT OF IONIZING RADIATION ON THE STRUCTURAL CHANGES IN RUBBER-PLASTIC SYSTEMS (USSR)

Blokh, G. A., V. A. Zhurko, M. A. Vyazankina, M. A. Vas'kovskaya, A. P. Meleshévich, F. V. Bronshteyn, and E. V. Tsipenyuk. Vysokomolekulyarnyye soyedineniya, v. 5, no. 4, Apr 1963, 605-613.

S/190/63/005/004/019/020

Structural changes produced by ionizing radiation in doses of 1 to 100 Mr in rubber-plastic systems have been studied at the Dnepropetrovsk Institute of Chemical Technology. The changes in properties were evaluated from thermomechanical curves in the range from about 60 to 220°C and from swelling data. The experiments were conducted with systems of sodium butadiene (CKB), butadiene-styrene (CKG-30), or natural rubber and low- or high-pressure polyethylene or polystyrene (rubber:plastic ratios, 80:20, 50:50, and 20:80) irradiated in air without heating. The thermomechanical curves of individual nonirradiated and irradiated systems differ sharply from one another.

Card 1/2

AID Nr. 980-17 31 May

## EFFECT OF IONIZING RADIATION [Cont'd]

8/190/63/005/004/019/020

At a given temperature and radiation dose, network structure formation, indicated by a loss of deformability and by the absence of viscous flow, was shown to be induced by irradiation. The density of cross links in individual systems, determined by Flory's swelling method, was shown to increase with an increase of the dose and to depend on the nature of the rubber and the rubber-to-plastic ratio. In polymers containing phenyl groups radiation-induced structural changes proceeded slower and required higher radiation doses. Analysis of the results of the study indicates that ionizing radiation apparently causes a covulcanization of the rubber and the plastic and is accompanied by a change in the physical and mechanical properties of the system: a sharp decrease in plasticity, a decrease in swelling, and increases in hardness, tensile strength, and wear resistance. It is concluded that irradiation of combinations of rubbers and plastics in predetermined ratios makes possible the production of materials with the desired improved properties.

TITLE: Intensification of vulcanizing processes with the aid of the triple accelerator system Tsimat-DFG-Santocure

SOURCE: IVUZ. Khimiya i khimicheskaya tekhnologiya, v. 6, no. 6, 1963, 1025-1030

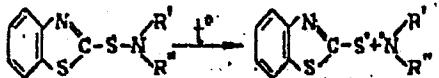

TOPIC TAGS: vulcanization, accelerator, Tsimat, diphenylguanidine, sulfenamide, Santocure, Tsimat diphenylguanidine Santocure system, methyl ziram, rubber, acceleration mechanism, vulcanization mechanism, free radical formation, vulcanization process, tire manufacture

ABSTRACT: Vulcanization kinetics were studied at different temperatures and times using double and triple accelerator systems including Tsimat (zinc dimethyl-dithiocarbamate) / Abstractor's note: Tsimat is equivalent to domestic product known as methyl ziram. / The effectiveness of the double Tsimat-DFG (diphenylguanidine) system and the triple Tsimat-DFG-Santocure for vulcanizing carbon black filled wear-resistant rubber mixtures was studied. Introduction of the three-component accelerator system reduces the temperature (from 143 to 120 C) and

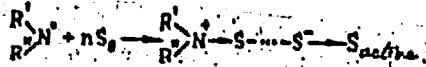

Card 1/5

ACCESSION NR: AP4025265

time (from 50 to 30-40 minutes) requirements for vulcanization. The effectiveness of the components of the system on acceleration of vulcanization is shown in the figure. Lowering the temperature by 10 C doubles the working time of the triple acceleration system. The mechanical properties of the rubbers obtained with the three-component system at the reduced vulcanization temperature of 120 C are equivalent to those of control samples. It is suggested that this low temperature vulcanization be applied to the tire industry as well as to the preparation of other rubber articles. The action of the accelerator system is depicted as follows: decomposition of the sulfenamide (Santocure) to radicals:

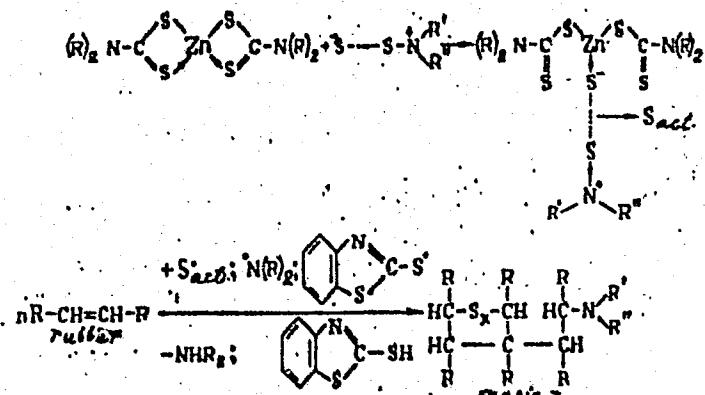

activation of the sulfur by the DFG and the amine radicals formed by the sulfenamide decomposition

Card 2/5

ACCESSION NR: AP4025265

and the formation of the polysulfide complex of Tsimat, which also gives off active sulfur fragments which crosslink the rubber:

TITLE: Vulcanization of rubber compounds in the presence of filled zeolites

SOURCE: Kauchuk i rezina, no. 2, 1964, 1-5

TOPIC TAGS: rubber, rubber compound, vulcanization, scorching, accelerator, Altax, Santocure, phenylguanidine, zeolite, filled zeolite, ammonia, methylamine, dimethylamine, ethanolamine, adsorption, kinetics of desorption

ABSTRACT: The vulcanization of protective and brake rubber compounds from natural and butadiene-styrene rubbers of the SKMS-30ARKM brands was conducted in the presence of synthetic zeolites of the NaKh type with pores 10 Å in diameter, filled with ammonia, methylamine, dimethylamine, monoethanolamine, and diethanolamine. These filled zeolites were used in the capacity of secondary accelerators of vulcanization (instead of Altax and diphenylguanidine) in combination with the basic accelerator Santocure. It was found that an increase of ammonia content in protective and brake rubber compounds to 0.25 and 0.40% (by weight), respectively,

Card 1/3

ACCESSION NR: AP4017159

permitted the production of materials with a higher degree of vulcanization, while still preserving the resistance of the compounds to scorching. The use of ammonia-filled zeolites also resulted in a substantial saving of time, achieving within 30 minutes a degree of vulcanization for protective rubber equal to that attained by Altax in 50 minutes. Methylamine and dimethylamine exert a similar effect on the vulcanization of rubber compounds when used in association with zeolites. While the ethanolamines are known to act as accelerators of vulcanization, their direct application causes (within 20-26 minutes at 110C) some scorching of the compounds during the working operation. However, when adsorbed on zeolites, monoethanolamine and diethanolamine impart to brake-rubber compounds a state of plastic flow which lasts for 37-39 minutes. It was found that the physical and mechanical properties of these vulcanized rubbers were practically identical with those of the vulcanizates produced with the aid of Altax and diphenylguanidine. The kinetics of desorption of amines from zeolites at various temperatures was studied, and it was observed that a 10-minute heating at 140C caused the desorption of only 40% monoethanolamine and 18% diethanolamine. The capacity of zeolites to retain the amines at elevated temperatures lessens the danger of scorching in the vulcanization process. Orig. art. has: 3 tables and 2 charts.

Abstract: The effect of organic vulcanization accelerators on rubber-to-metal bonding strength has been studied for natural, nitrile, chloroprene-styrene (SNS-30), and triethylamine.

SOURCE: Kauchuk i rezina, no. 9, 1964, 22-4

TOPIC TAGS: rubber-metal joint, rubber to metal bonding, bonding strength, natural rubber, nitrile rubber, chloroprene-styrene rubber, chloroprene rubber, vulcanization accelerator

ABSTRACT: The effect of organic vulcanization accelerators on rubber-to-metal bonding strength has been studied for natural, nitrile, chloroprene-styrene (SNS-30), and triethylamine.

The results of the study given in the table show that natural rubber exhibit satisfactory bonding strength (43.1-57.0 kg/cm<sup>2</sup>) with the exception of those made with the ultra-accelerator triethylamine diethyldithiocarbamate, because in this case the vulcanizing sulfur reacts faster with rubber than with brass. The lowest bonding strength

Card 1/2

L 15253-65

ACCESSION NR: AP4045699

is exhibited by SKS-30 rubbers. In the case of Nafrit E, the bonding strength of the rubber-metal and disulfides have to be increased to 53.5 kg/cm<sup>2</sup>. Most accelerators do not affect the bonding strength of chloroprene rubber; sulfur increases the bonding strength of Nafrit E to 66.6 kg/cm<sup>2</sup>. It is concluded that the bonding metal bonding strength is highly dependent on the type of accelerator used. Experimental rubber-metal shock absorber parts based on natural rubber have been successfully tested at the Krivoy Rog Institute of Rubber Technology. Figures and tables.

TITLE: The use of carbon black in cable resins.

SOURCE: Ivuz. Khimiya i khimicheskaya tekhnologiya, v. 7, no. 2, 1964, 307-312.

TOPIC TAGS: carbon black, cable resin, filler, thermal aging resistance, channel black, lamp black, furnace black, thermal black, thermal oxidation, tensile strength, elongation, physical mechanical property, insulating type resin, electrical insulating property, volatility, stability

ABSTRACT: A study was made of the effect of different types of carbon blacks and their combinations on the thermal aging resistance of hose and cable resins. Lamp, channel, furnace and thermal carbon blacks and combinations of 60 parts lamp, furnace or thermal black with 40 parts channel black were tested in a recipe SHVP-50 (in %: NK-35.0; SKEM-50R-15; S-1.0; Captax- 0.35; ZnO-2.5; furnace black- 21.95; channel black-14.70; stearin-2.5; Neozone "D"-0.5, rosin-1.5; paraffin-5.0). Vulcanization was at 143°C; resistance to thermal oxidation at 85, 100 and 110°C was

Card

1/3

ACCESSION NR: AP4041684

tested. The resins filled with channel black were the least stable to prolonged aging at either temperature. The combination of 2 different blacks (furnace, lamp or thermal) improved the resistance of the resins to thermal aging at 85 and 100C as indicated by higher tensile strength and elongation; these values were much lower when the temperature was increased to 110C. There seemed to be no correlation between the amount of volatiles at the different temperatures and the mechanical properties of the resin. Examination of the effect of a combination of channel black, mercaptobenzothiazole and thiuram on the physical mechanical properties of insulating type resins showed that addition of 5-10 wt. parts of channel black and 3 wt. parts of Captex increased the strength of the vulcanizates (from 47-67 kgs/cm<sup>2</sup>) without changing their electrical insulating properties. Orig. art. has: 1 figure and 4 tables.

Organic accelerators in the vulcanization of rubber (Organicheskiye uskoriteli vulkanizatsii kauchukov) Moscow, Izd-vo "Khimiya", 1964. 540 p. illus., biblio., index. Errata slip inserted. 4600 copies printed.

TOPIC TAGS: organic accelerator, synthetic rubber, rubber chemical, rubber

PURPOSE AND COVERAGE: Presented are physical and chemical data on important accelerators, activators, vulcanization systems, information on the synthesis and structure of accelerators, on the chemical basis of accelerating effects, and on the effect of accelerators on the property of rubber. The book deals briefly with the protection methods of rubber blend from scorching. The book is intended for a broad circle of chemists and technologists who are working in chemical, rubber, cable, light and other industries engaged in synthesis and in the use of accelerators. It can be useful for scientific workers and for students of advanced and secondary schools specializing in rubber manufacturing.

ABSTRACT: Vulcanization of ethylene-propylene rubber

SOURCE: IVVZ. Tekhnologiya lekkoj promyshlennosti, no. 4, 1965, 57-62

TOPIC TAGS: vulcanization, ethylene, propylene, peroxide, rubber, zcolite

ABSTRACT: Vulcanization of ethylene-propylene rubber with aluminum oxide (I), or calcined silica gel (II), or aluminum peroxide (III) in the presence of zcolite in liquid phase. Direct introduction into the reaction mixture of the last two reagents is not recommended because of their low solubility in organic solvents. It is recommended to dilute them in a suitable solvent before adding to the reaction mixture.

TITLE: The effect of OS-2 alkane on polar rubber vulcanization 15

SOURCE: Kauchuk i rezina, no. 5, 1965, 14-17

TOPIC TAGS: alkane, rubber, rubber mix, rubber property, rubber product, rubber vulcanization, vulcanization, vulcanizate, vulcanized rubber, OS-2 alkane, IHN, rubber

ABSTRACT: The effect of the OS-2 alkane on rubber vulcanization was studied in the binary system rubber-OS-2 and also in the standard mixture

Cord 1/5

L 54820-65

ACCESSION NR: AP5013733

noted with the further increase. The formation of the cross-link structure in chloroprene mixtures was intensified under the action of the OS-2. At 100°C the cross-linking of the mixture decreased. At 150°C the cross-linking increased again. At 200°C the cross-linking decreased again. The effect of the OS-2 on the cross-linking of the mixture containing lampblack was more intensive than that of the mixture containing carbon black.

At 100°C the temperature required for the formation of the cross-link structure was unchanged. At 100°C the formation of cross structure was more intensive in the mixtures containing lampblack; the effect of the OS-2 on this process is shown in Fig. 1 on the Enclosure. Orig. art. has 4 tables and 7 figures.

TITLE: Vulcanization<sup>1544</sup> of synthetic rubbers with gaseous systems on zeolite carriers. I. Vulcanization of cis-1,4-butadiene<sup>15</sup>(SKD) and sodium butadiene (SKB) rubbers with sulfur dioxide and hydrogen sulfide

SOURCE: IVUZ. Khimiya i khimicheskaya tekhnologiya, v. 8, no. 5, 1965, 846-850

TOPIC TAGS: vulcanization, synthetic rubber, sulfur dioxide, hydrogen sulfide

ABSTRACT: A study has been made of the vulcanization of synthetic rubbers with sulfur dioxide in combination with hydrogen sulfide and mercaptans. The vulcanizing systems were prepared by adsorption of these gases on A and X type zeolite carriers. Study of the sorption and desorption of the gaseous systems by zeolites showed that the bulk of the gases is retained in the zeolite structure at temperatures at which rubber mixtures are prepared and processed, and is released

Card 1/2

UDC: 678.028:66.022.37

L 2783B-66

ACC NR: AP6002212

only at vulcanization temperatures. Thus, scorching is prevented and vulcanization made possible. Experiments conducted with cis-butadiene (SKD), sodium butadiene (SKB), and butadiene-styrene (SKS-30ARKM) rubber mixtures showed that these rubbers can be vulcanized with combinations of SO<sub>2</sub> and H<sub>2</sub>S or 2-mercaptobenzothiazole. The physical and mechanical properties of vulcanizates thus prepared were on par with those of sulfur-vulcanized rubbers. The effect of zeolites on the properties of unfilled sulfur vulcanizates was studied for SKB rubber and NaX zeolite. It was shown that the reinforcing properties of the zeolite are very poor, and that the zeolite sharply increases the residual elongations of vulcanizates. Orig. art. has: 3 figures and 3 tables.

TITLE: <sup>15</sup>Vulcanization of butadiene-nitrile rubber <sup>15</sup>with hydrogen sulfide in the presence of di-tert-butyl peroxide introduced on zeolites

SOURCE: AN UkrRSR. Dopovid, no. 4, 1966, 483-487

TOPIC TAGS: vulcanization, synthetic rubber, hydrogen sulfide, zeolite

ABSTRACT: It is shown that rubber products based on butadiene-nitrile rubbers (SKN-26, SKN-40) can be obtained with H<sub>2</sub>S and admixtures of di-tert-butyl peroxide DTBP (0.05-0.5 pts. by wt. per 100 pts. of rubber). Synthetic zeolites were used as carriers (Na<sub>4</sub> for H<sub>2</sub>S and NaX for DTBP). Unfilled rubbers, or rubbers filled with inert fillers (chalk, etc.) were found to surpass sulfur-cured rubbers in physicomechanical properties, resistance to thermal aging, and stability toward aromatic hydrocarbons (xylene). The paper was presented by Academician AN UkrSSR Ovcharenko, F. D. Orig. art. has: 4 figures and 1 table.

accelerators

SOURCE: Vses khim obshch. Zh., v. 11, no. 3, 1966, 348-350

TOPIC TAGS: vulcanization, rubber, silicon plastic

ABSTRACT: The effect of porous silicon fibers containing hydrogen sulfide, ammonia,  
and sulfur dioxide on the physicomechanical properties of tire rubbers was investigat-  
ed. The pore diameters ranged from 2.8 Å to 75 Å. The vulcanization temperature was  
143-163°C and the vulcanization duration was 10-80 minutes. The fiber contents in  
the rubber were as high as 10%. Up to 10 wt %, the incorporation of the silicon fib-  
ers affected neither the vulcanization process nor the mechanical properties of the tire  
rubbers. It was found that rubbers prepared using ammonia accelerators were qua-  
litatively as good as those vulcanized with sulfur compounds and diphenylguanidine ac-  
celerators.

TITLE: Synthesis of peroxidated rubbers and nonsulfur vulcanization of these rubbers

SOURCE: Kauchuk i rezina, no. 12, 1966, 6-8

TOPIC TAGS: peroxidated rubber, peroxide monomer, butadiene, styrene, peroxidated rubber vulcanization, peroxidated rubber vulcanizate, nonsulfur vulcanization

ABSTRACT: A study has been made of the nonsulfur vulcanization of rubbers involving preliminary introduction of side peroxide groups in the elastomer backbone. The peroxide-group-containing ("peroxidated") rubbers were synthesized by emulsion copolymerization of butadiene, styrene, and tert-butyl 2-acrylatoethyl peroxide (AP)

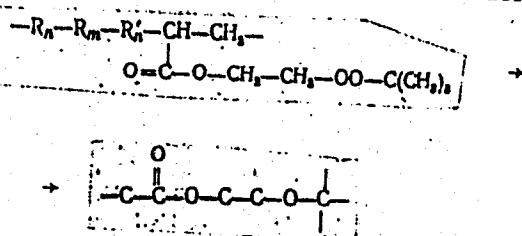

The percentages of the monomers were: butadiene, 67.5-73.0%; styrene, 25%; AP, 2.0-7.5%. The copolymerization procedure is described in the source. The rubber mixtures were prepared at 50°C on mills using standard recipes for butadiene-styrene

Card 1/2

UDC: 678.760.2-139.004.12

ACC NR: AP7000910

rubbers. Vulcanizes with the best properties were obtained from peroxidated rubber containing 3.5% AP, and vulcanized at 140°C for 30 min (tensile strength, 203 kg/cm<sup>2</sup>; elongation, 543%; residual elongation, 15%). The high vulcanizing effectiveness of peroxide groups, preliminarily introduced in the rubber, is due to their attachment to and regular distribution in the macromolecules:

The proposed nonsulfur vulcanization method makes it possible: 1) to control the distribution and concentration of crosslinks; and 2) to control the length and type of the crosslinks by using different peroxide monomers. Orig. art. has: 1 figure and 2 tables.

Evaporation, Clay

Effect of sulfite-alcohol slopes on accelerating evaporation in clay drying. P. P. Budnikov, M. I. Khterovich, G. S. Blokh., Dokl. AN SSSR, 82, no. 1, 1952.

SO: Monthly List of Russian Accessions, Library of Congress, April 1952 ~~1853~~, Uncl.

*Effect of sulfate-alcohol wash water on the ultimate shear stress of clay mix.* P. P. BUDNIKOV AND G. S. BLOKH. *Doklady Akad. Nauk S.S.R.*, 89 [6] 897-900 (1953). Shear stress of brick clay mix containing 10 to 28% moisture and 0.1 to 1% sulfate-alcohol wash water was determined with a conical plastometer. Plastic strength was reduced by the surfactant, but no symbiotic relationship was observed between the content of the surfactant and the decrease of the ultimate shear stress. The use of a surfactant makes possible a decrease in the amount of mixing water. B.Z.K.

Investigations of clay by the Brabender cone penetrometer.  
I. A. Al'perovich, P. I. Petrushina, and G. S. Blukh (*Gloss & Ceramics*, Moscow, 1953, 10, No. 8, p2). Formulas are given for calculating limiting shear stresses in clay in the plastic state and for determining the yield value of clay at low moisture-content. Experiments showed that the cone penetrometer is suitable for determining the consistency of clay (i.e., degree of wetness). A method (and its theoretical basis) for determining the surface moisture-content and the surface moisture-gradient of green products necessary for the determination of the drying-schedule is given. The plastometer described is simple and gives reproducible results.

54. The semi-dry pressing of clay pipes.—G. S. BLOKH, P. M. ZAKONTS, E. I. ROKH-MIT  
VANCOUVER, and N. P. SHEVARDYAEV (*Glass & Ceramics*, Moscow, 12, No. 6, 17, 1955).  
In Russia, the authors describe a hydraulic press and the procedure of semi-dry  
pressing, which they claim is simpler and cheaper than plastic shaping. The mix for  
pressing at 8-10% moisture content comprised 65% Kudinovskii clay and 35% grog  
from the same clay. Drain pipes 4-7 ft. long and c. 8 in. dia. were made at 1,400 lb/sq.  
in., taking 8 min. per pipe. (1 fig.)

Inst Title : The Indirect Evaluation of the Frost Resistance  
of Construction Materials.

Orig Pub : Stroit. materialy, izdeliya i konstruktsii, 1956,  
No 3, 32-34

Abstract : An attempt is made to establish a correlation  
between data on the direct and on the indirect  
evaluation of the frost-resistance of construc-  
tion materials on the basis of an analysis of construc-  
tive literature data as well as of direct experimen-  
tal material. It is noted that a successful  
solution of the problem requires that the

following factors be taken into account:  
the method used in the determination of the  
frost-resistance coefficient (FRC); the  
additional moisture absorption during freezing  
and during thawing; the migration of moisture  
on freezing; the evolution of a part of the  
freezing moisture at the surface of the material;  
and the incompleteness of ice formation during  
freezing. It is shown that a clear correla-  
tion between the magnitude of the FRC and the  
frost resistance of the articles, determined  
by the direct method, can be established only  
in those cases when the materials compared  
have properties which agree with respect to
