TITLE: Hydrostatic spherical thrust bearing

SOURCE: Elektrotehnika, no. 8, 1965, 18-24

TOPIC TAGS: antifriction bearing, lubrication

ABSTRACT: Recently hydrostatic sliding bearings are becoming widely used in power machine building. In such bearings the lubricant is introduced into friction gaps under pressure. The pressures are chosen in such a way as to equilibrate the external load by means of a specified thickness of the lubricant. The present article describes the methods for the design of hydrostatic spherical thrust bearings with a central high pressure chamber and annular lubricant supplying chambers. It covers spherical thrust bearings with diffusor gaps, with central lubricant introduction, with constant gap between the pivot and the bearing, and with a confusor gap. Results of the calculations show that in the case of central lubricant-introducing chambers the best thrust bearings are those with a ratio of lubricant supply opening angle to bearing angle of approx. 0.5. In addition, the thrust bearing with a confusor gap exhibits the best characteristics and is easiest to produce. Orig. art. has: 8 figures and 54 formulas. [JPRS]

TITLE: A method for calculating the carrying capacity of plain support bearings of finite lengthSOURCE: Kharkov. Politekhnicheskiy institut. Vestnik, no. 1(49), 1965,
Mashinostroyeniye, no. 1, 96-101TOPIC TAGS: Journal bearing, finite difference, partial differential equation,
REYNOLDS NUMBER

ABSTRACT: The authors use the method of finite differences to solve the three-dimensional Reynolds equation in the dimensionless form

$$\frac{\partial}{\partial \varphi} \left(h^3 \frac{\partial p}{\partial \varphi} \right) + \frac{\partial}{\partial z} \left(h^3 \frac{\partial p}{\partial z} \right) = -\frac{\partial h}{\partial \varphi}.$$

Methods are given for approximating the derivatives in the left member of this equation to any degree of accuracy and for reducing the equation to a form suitable for approximation. A system of finite-difference equations is derived which approximates the given equation in the matrix form and this system is solved by the relaxation

TITLE: Calculation of a flat hydrostatic thrust bearing with central chamber taking account of nonisothermicity due to rotation

SOURCE: IVUZ. Mashinostroyeniye, no. 11, 1966, 59-64

TOPIC TAGS: hydrostatic bearing, fluid ^{flow} mechanics, hydrodynamics, viscous fluid, incompressible fluid, lubricant

ABSTRACT: The authors consider the problem of designing a flat externally pressurized thrust bearing with a central oil feed chamber taking rotational nonisothermicity into account. Energy dissipated through pumping is disregarded. Thus the problem reduces to a special case of the hydrodynamic problem of motion of a viscous fluid in the clearance between bearing and base. It is assumed that flow of the lubricating layer is laminar, that all generated heat is carried away by the oil, that viscosity is independent of pressure and constant with respect to the thickness of the layer, that the lubricant adheres to the base and to the bearing and completely fills the gap between them. Forces of inertia and gravity are disregarded and the lubricant is treated as an incompressible fluid. An expression is derived for the supporting power of a bearing of this type in terms of oil pressure and viscosity, flow parameters and geo-

Card 1/2

Abstract : In 83 infected lizards of 10 species, 21 species of helminths were discovered. The ecologically similar representatives of different genera of agamous lizards -- the steppe agama and the big-eared round-head -- have the greatest number of parasites in common. The ecologically further distant representatives of one genus -- the steppe and Caucasian agamas -- had no parasitic worm species in common. In the helminthofauna of agamous lizards adapted

TITLE: Complex Concentration of the Apatite-and-nepheline Ore of the Khibiny Occurrence (O kompleksnom obogashchenii apatito-nefelinovoy rudy Khibinskoj mestorozhdeniya)

PERIODICAL: [Tr.] Vses. n.-i. i proyektn. in-ta mekhan. obrabotki poleznykh iskopayemykh, 1957, Nr 102, pp 210-221

ABSTRACT: The apatite-and-nepheline ore of this occurrence consists primarily of apatite, nepheline and, in smaller quantities, aegirite, titanomagnetite, and others. A flotation process for obtaining apatite concentrate, with oleic acid and water glass as the collectors was developed. Another flotation procedure was developed to obtain nepheline concentrate. Oleic acid and peat pitch in combination serve as the collector for flotation of aegirite and the titanium minerals. Tests of a process involving bulk concentration of the Ti minerals and aegirite were run with the purpose of developing a procedure for the complex concentration of apatite-and-nepheline ore. Sulfate soap from the Seget plant is used as the collector. 47% of the 0.074 mm

Complex Concentration of the Apatite-and-nepheline Ore (cont.)

undersize took grinding. Optimum alkalinity for the flotation of aegirite and the Ti minerals is appx. 10.5 pH. The use of 100-150 g NaOH per ton makes it possible to reduce the consumption of collector. Thus, in the flotation of tailings of apatite flotation, a nepheline concentrate may be separated from the cell product, with ~ 76% recovery. Under these conditions, the Ti and Fe are extracted for the most part in the bulk concentrate and in the apatite product, which also served to separate the Ti minerals and the aegirite. For more complete separation of alumina and P from these products, the froth products were recleaned once again. A flowsheet for the flotation of the Ti minerals, with the points at which reagents are added and the consumption thereof, is presented.

Academician, member USSR. Institute metallurgist.
 Sovremennye problemy metallicheskogo (Modern Problems in Metallurgy).
 Moscow, Izd-vo Akad. Nauk SSSR, 1956. 640 p., 35,000 copies printed.
 Bep. Mat. A.M. Samarskiy, Corresponding Member, USSR Academy of
 Sciences, Eds. of Publishing House V.D. Krasnakov, and
 A.F. Derzhav. Tech. Ed. I.Y. Polyukova.

PURPOSE: This book is intended for scientists and technical per-
 sonnel in the field of metallurgy.
 CONTENT: This is a collection of articles on certain aspects of
 Soviet metallurgy. The book is dedicated to Academician
 Ivan Pavlovich Martin on the occasion of his 75th birthday. The
 book is divided into several parts. The first part consists of
 articles presenting a brief account of the biography and
 professional activity of the Soviet metallurgist. It includes an
 article by Jean Chaperon, Michael Grant, and John Elliott (M.I.T.)
 describing their meeting with Martin in Moscow and also his
 visit to the United States. The second part consists of three
 articles and deals with raw materials and fuels for the Soviet
 metallurgical industry. The third part represents the major
 portion of the book. It consists of 25 articles dealing with
 various aspects of the metallurgy of pig iron and steel.
 The fourth part consists of two articles treating the smelt-
 ing of nonferrous metals. The fifth part consists of three
 articles on the smelting of metals. The sixth part consists of
 eight articles discussing certain aspects of physical metal-
 lurgy. The last part deals with general problems in the field
 of metallurgy. References are given after each article. No
 references are mentioned.

TITLE: The Kinetics of the Absorption of Flotation Reagents by Minerals (Kinetika pogloshcheniya flotatsionnykh reagentov mineralami)

PERIODICAL: Tsvetnyye Metally, 1959, Nr 3, pp 12 - 18 (USSR)

ABSTRACT: The authors note the scarcity until recently of research on the kinetics of flotation-reagent absorption. They refer to the work at Gintsvetmet, directed by S.I. Mitrofanov (Ref 1) in this field, which led to equations by which their own results could be represented. Figure 1 shows the linear isotherms of the logarithm of absorption against the logarithm of time for xanthate consumptions of 1 000 and 50 g/ton. The authors consider first the rate of exchange of ions of the same and of different valencies when the amount of sorption is negligible. The use of an adsorption column (Figure 2) enables reagent-absorption to be measured in 2-3 sec and greatly reduces the influence of ions displaced from the mineral surface on subsequent sorption. Integrating the rates of sorption deduced for infinitesimal layers the

Card1/3

SOV/136-59-3-4/21

The Kinetics of the Absorption of Flotation Reagents by Minerals

authors obtain an expression for that in the whole column, showing that for equi-valent ion exchange the rate is proportional to the initial concentration of the solution, i.e. the proportion of the reagent absorbed in the mineral does not depend on the initial concentration. They go on to consider the exchange of ions of different valencies. Their experiments on the sorption of xanthate by galenite showed (Figures 3,4) contrary to their equation, that the relation between sorption and initial concentration is almost linear. This could be due to only one ion of xanthate being linked with one lead ion in the galenite crystal lattice, a type of sorption which has been shown (Ref 2) to be possible. They conclude that possibly experimental data on the absorption kinetics do not always reflect the mechanism of sorption (when the controlling factor is the diffusion of the reagent through the water envelope to the mineral surface). The other broad case considered is when the action of the reagent produces a multiple layer on the mineral surface. Here, the rate-controlling process is the diffusion of the reactants

Card2/3

SOV/136-59-3-4/21

The Kinetics of the Absorption of Flotation Reagents by Minerals

through the layer of reaction products and the authors deduce equations which represent their experimental results (Figure 5). In these experiments a weighed portion of galenite was stirred with xanthate solution at a solid:liquid ratio of 1:4. There are 5 figures and 3 references, 2 of which are Soviet and 1 English.

TITLE: The main trends in using radioactive isotopes for studying physico-chemical foundations of the flotation process

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 1, 1962, 8, abstract 1063
("Tr. Vses. n.-i. i proyektn. in-ta mekhan. obrabotki poleznykh iskopayemykh", 1961, no. 128, 3-16)

TEXT: The paper describes the application of the method of radioactive isotopes for the study of the physico-chemical foundations of the flotation process; for the study of the interaction of minerals with various classes of flotation reagents; collectors, activators, and depressors; for the study of sorption kinetics of flotation reagents, for the study of the distribution of the sorbed reagents on the interface boundary mineral-solution and solution-gas, and others. The advantages and limitations of the method of radioactive isotopes are analyzed. The conclusion is drawn that in many cases this method may be successfully used for investigating the action of flotation reagents only when it is done in combination with other methods: with the method of infrared spectro-

TITLE: Studying the effect of sodium oleate and flotation modifiers under conditions of floatating beryl, spodumene and fluorspar

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 5, 1962, 7, abstract 5G42 ("Tr. Vses. n.-i. i proyektn. in-ta mekhan. obrabotki poleznykh iskopayemykh", 1961, no. 128, 26-36)

TEXT: Results are given from investigating the interaction of beryl, spodumene and fluorspar surfaces with oleic acid (I) containing radioactive isotope C¹⁴, ferric chloride with Fe⁵⁹ isotope, and H₂SO₄ with S³⁵ isotope. The quantity of a reagent sorbed by minerals, was determined on flotation products by direct measurement of the radiation intensity of the mineral powder. To measure the intensity of preparations I, the method of scintillation reading was employed with the aid of liquid scintillators. Flotation experiments were carried out with a laboratory mechanical-type machine of 160 ml volume, at 1:8 solid-liquid ratio. The studies were applied to the existing acid and alkaline schemes of separating beryl, spodumene and fluorspar. Prior to flotation, the mineral batch was mixed

Card 1/2

Studying the effect of sodium oleate ...

A006/A101

in a cup with a solution of required flotation reagents at a given liquid-solid ratio. To study the nature of I and sodium oleate (II) fixation on beryl and spodumene, the method of infrared spectroscopy was used. The joint processing of the minerals with reagents was performed in a special adsorption column. As a result of investigating sorption of I and II; the effect of pH; processing with HF and H_2SO_4 , and with a mixture of these acids; processing with NaOH, on flotation of beryl, spodumene and fluorspar, and sorption of oleate by their surfaces, the conclusion is drawn that during the interaction of II with beryl, spodumene and fluorspar, both physical sorption of I molecules and chemical sorption of oleate ions take place. Highest sorption capacity is shown by spodumene, which corresponds to its better flotability. Optimum beryl flotation and sorption of beryl oleate occurs in the neutral range; and those of spodumene in the weakly alkaline range. The activating effect of HF upon beryl and of NaOH upon beryl and spodumene, is predetermined by more favorable conditions developed on the mineral surface for the chemosorptional fixation of the ion collector; this is connected with the selective dissolving in HF of silicate groups. Beryl depression, non-activated and preliminarily activated with HF, after processing with H_2SO_4 is explained by reduced sorption of the collector and its fixation prevalently in molecular form.

TITLE: Linear induction accelerator	
SOURCE: Atomnaya energiya, v. 21, no. 6, 1966, 439-445	
TOPIC TAGS: linear accelerator, electron accelerator, mev accelerator	
ABSTRACT: A description is given of the LIU-3000 linear induction accelerator, which was designed at the Scientific-Research Institute for Electro-Physical Devices (NIIEFA) in 1962. The LIU-3000 was designed for an energy of 3 Mev and a pulse current of up to 200 amp. Its operation for electron acceleration is based on the utilization of a rotational electric field, created in a system consisting of several circular transformers. The maximum possible current of the accelerated electrons in such an accelerator with focusing sufficient to compensate for the repelling force of the space charge, is determined basically by the power of the commutating element in the primary circuit of the inductor. The LIU-3000's power can be brought to 1000 amp/pulse, what is impossible in other types of accelerators. The	
Card 1/2	UDC: none

ACC NR: AP7002162	LIU-3000 consists of a series of accelerating sections (the first of which was adjusted in 1963). Each section consists of 12 inductors which are vacuum sealed to permit a vacuum of 5×10^{-6} torr inside. The sections are connected in pairs into units with the aid of special pipes. Pumping and observation devices are situated between the units. The following data were obtained from tests: maximum current of accelerated electrons, 180 amp; maximum energy of injected electrons, 300 kev; energy of accelerated electrons, 485 kev; duration of the current pulse of the gun, 2.2 μ sec; pulse duration of the accelerating voltage, 0.35 μ sec; duration of the pulse front of accelerating voltage, 0.18 μ sec; average gradient of accelerating field, 310 kv/m; and diameter of the accelerated beam (at the exit), 2 cm. In addition to the authors, other staff members of NIIEFA who participated in designing and testing the LIU-3000 were R. A. Alekseyev, L. M. Andrezen, A. V. Belyayeva, O. D. Volodin, M. A. Gashev, V.
