TITLE: On the properties of the matrices of Daffin-Kemmer

PERIODICAL: Akademiya nauk Belaruskaya SSR. Doklady, v. 6, no. 2, 1962, 81-85

TEXT: The most important properties of the Daffin-Kemmer matrices are obtained on the basis of general considerations. The following representation of the matrix β_μ with the aid of the projective operations $P^{(k)}$ and $\bar{P}^{(k)}$ (separating respectively the scalar and vector (tensor) part of the k -dimensional space: $k = 5, 10$) is used as starting point:

$$\beta_\mu = P\beta_\mu P + \bar{P}\beta_\mu \bar{P} \quad (3)$$

The rules of commutation are obtained from here:

$$\beta_\mu P + P\beta_\mu = \beta_\mu; \quad \beta_\mu \bar{P} + \bar{P}\beta_\mu = \beta_\mu \quad (5)$$

The general form of the projective operators P and \bar{P} is then obtained:

$$P = \frac{\beta^2 - a_1}{a_2 - a_1}, \quad \bar{P} = \frac{\beta^2 - a_2}{a_1 - a_2} \quad (10)$$

Card 1/2

On the properties of the...

ensue by summation over the final spin states of the proton and the electron. With $f_3 = 0$ this scattering cross section agrees with the formulas hitherto known. The initial dipole structure does not contribute in any way to the polarization correction $\sim |\Omega|^2$, if only the initial spin states of particles are used. f_1 and f_2 can be determined by twice measuring the difference $d\sigma - d\sigma_+ \sim |\Omega|^2$. The lab-system cross section

$$\frac{d\sigma_n}{d\Omega} = \frac{\alpha^2 p_\pi}{q_n^4} \{|\mathfrak{M}|_n^2\} = \left(\frac{\alpha}{2p_{10}'}\right)^2 \frac{\cos^2(\theta/2)}{\sin^4(\theta/2)} \left(1 + \frac{2p_{10}'}{\kappa} \sin^2 \frac{\theta}{2}\right)^{-1} \times \quad (10)$$

$$\times \left\{ F_1^2 + \frac{q_n^2}{4\kappa^2} \left[2(F_1 + iF_2)^2 \operatorname{tg}^2 \frac{\theta}{2} + (iF_2)^2 + (\lambda F_3)^2 \right] \right\}.$$

of the scattering of unpolarized particles from protons without dipole moment agrees with the formula by M. N. Rosenbluth (Phys. Rev., 79, 625, 1950), if $\kappa \rightarrow 0$. With q small the formfactor λF_3 is small, with q large it makes a certain contribution to the scattering cross section. With $q^2 = 30f^{-2}$ λF_3 is of the order of 10^{-2} . The three unknown quantities

Card 4/5

Electron-proton scattering ...

S/056/62/043/005/049/058
B125/B104

F_1, F_2 and F_3 in $d\sigma/(dQ \sigma_{NS}) = a_{11}F^2 + a_{12}F_1F_2 + a_{22}F_2^2 + a_{33}F_3^2$ can be determined from at least three experimental cross sections. The independence of a_{33} from the scattering angle ψ (with q^2 fixed) can be important in determining the influence of the dipole structure.

TITLE: Determining the form factor of electrons

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 44,
no. 1, 1963, 303-305

TEXT: In a former paper (Vestsi AN BSSR, ser. fiz.-tekhn. navuk, 2,26, 1962), the differential electron-electron scattering cross section of high-energy electrons was calculated in Born's approximation, allowing for charge distribution and magnetic momentum. The longitudinal polarizations in the initial and final states were taken into account for both electrons. Using a method due to G.V. Avakov (ZhETF, 37, 849, 1959), a system of four quadratic equations is obtained from the above cross section. The system serves to determine the way in which the four form factors (2 charge and 2 momentum factors) of the electron depend on the scattering cross section for polarized and unpolarized electrons, which can be determined experimentally. Determining the form factors of the electron when the polarizations are fixed in the initial or final state

Card 1/2

Determining the form factor ...

S/056/63/044/001/050/067

is also described. A system of 6 second-order equations and 6 variables is then obtained to determine the form factors of the electron.

TITLE: Wave Functions and the Calculation of Matrix Elements for Longitudinally Polarized Vector Particles

PERIODICAL: Akademiya nauk SSSR. Doklady. v. 149, no. 6, 1963, 1286-1289

TITLE: Recently, in view of the experimental discovery of particles with spin of 1, the development of the theory of vector mesons has been attracting considerable interest. Within the framework of 10-dimensional β -formalism, the author presents a compact matrix representation of the vector meson, which makes it possible to perform calculations of different effects of interaction on taking into account longitudinally polarized particles with spin of 1 on the basis of the covariant method of direct calculation of matrix elements. The most important English-language reference reads as follows: E. L. Hart et al., Phys. Rev. Lett., 9, 133 (1962).

TITLE: Scattering of a circularly polarized photon by a longitudinally polarized proton

SOURCE: AN BSSR. Doklady*, v. 8, no. 7, 1964, 441-443

TOPIC TAGS: photon, photon scattering, polarized photon, proton, polarized proton, scattering matrix

ABSTRACT: On the basis of the scattering matrix of a Pauli interaction, the differential scattering cross section for a photon incident on a proton is calculated in the first Born approximation, using the laboratory system in order to simplify the form of the spin projection operators. Using a Feynman diagram, an expression is obtained for the cross section, the contribution from the direct diagram for parallel spins being zero, as is also true in the center-of-mass system. This may be explained as compensation of spin waves because of opposite polarizations of the colliding particles. When an intermediate state is involved, this compensation does not occur and the contribution from the exchange diagram is not zero. An expression is given for the scattering cross section of a circularly polarized photon with positive spin projection and parallel spins, and it is noted that the derivation

TITLE: On the scattering of antineutrinos by electrons

B

SOURCE: Yadernaya fizika, v. 1, no. 2, 1965, 288-290

TOPIC TAGS: antineutrino scattering, electron scattering, form factor, vector meson, charge distribution, nonlocality parameter

ABSTRACT: The differential and total cross sections for the process $\bar{\nu}_e + e \rightarrow e' + \bar{\nu}'_e$, which has hitherto been discussed from the point of view of a weak contact interaction by several authors, are calculated in this paper by assuming the existence of intermediate vector mesons and by taking into account the possible charge distribution of the antineutrino. The possible information that can be obtained with existing experimental techniques is discussed, and possible methods of determining the nonlocality parameter due to the bosons and the Dirac charge form factor of the antineutrino are described. It is concluded that an account of the antineutrino charge form factor may be very important in the interpretation of experimental data on the process in question, and that if this form factor is small

Cord 1/2

L 45656-65

PERIODICAL: Tr. Novocherkas. politekhn. in-ta, 1956, Nr 33/47,
pp. 77-84.

ABSTRACT: The design and construction of saturation transformers
with a short-circuited winding is presented. Since
such a transformer contains two cores, it is possible
to connect in a compensating winding conveniently when
the transformer is used as an autotransformer. The
primary winding, which is connected to the uncompensated
circuit of the differential protection, is wound
around both cores; the secondary winding, which feeds

Card 1/2

A Saturation Transformer with a Short-Circuited Winding for
Differential Protection (Cont.)

the relay, is wound around only one core. A portion of the short-circuited winding is wound around one of the cores, and another portion of the winding is wound around the other core. The results of research on the number and relative position of the turns of the short-circuited winding on the saturation transformer characteristics are given. Presented also are experimental data on the effect of the number of turns and their relationship to the short-circuited winding on the characteristic $I_{sc} = f(k)$. Included are equations and equivalent circuits illustrating the design of saturation transformers with a short-circuited winding. M.G.R.

4403 THE RUSH OF MAGNETIZING CURRENT
AND THE THREE-PHASE
TRANSFORMER

The amplitude of the periodic three-phase currents may exceed the amplitude of the rated current. The experiments also showed that the periodic three-phase current is transformed without distortion by the different transformers. This means that it is possible to obtain different amplitudes of the three-phase currents at the output of the transformer even if the same currents enter the primary.

It is also possible to obtain different amplitudes of the three-phase currents at the output of the transformer even if the same currents enter the primary. This is due to the fact that the three-phase currents are not transformed by the same transformer.

ABSTRACT: Professor Sinel'nikov was born 11 May 1905 in Yekaterinoslav (now Dnepropetrovsk) in the family of a clerk. Following his graduation from the Khar'kov Electrical Engineering Institute in 1930 he was appointed chief of the Technical Division on Electric Drive at the Khar'kov Electrical Machinery Plant. Subsequently he was appointed research engineer at the Vol'ta Plant and later on transferred to Moscow, to the Institute of Experimental Medicine, while at the same time he continued his studies. In 1946 he started working as a senior scientific researcher at the All-Union Electrical Engineering Institute. Since September 1953 Professor Sinel'nikov has been working at the Novocherkassk Polytechnic Institute. At present he is head of the Chair of

Card 1/2

Electrical Machinery, Apparatus, and Computers and Mathematical Devices. He has been instrumental in establishing the computer laboratory at this institute, where research is being performed on the problems of utilizing computer engineering in the design and calculation of electromagnetic, mechanical, and thermal processes in electrical machinery and equipment. Since 1958 Professor Sinev'nikov has been Coordinating Editor of the journal Elektromechanika (Electromechanics) - one of the series published under the aegis of Izvestiya Vysshikh Uchebnykh Zavedeniy (News of Higher Schools). Yefim Markovich is moreover a prominent educator and the holder of many social honors and consultant to a series of industrial enterprises. For his great merits as an educator and for his scientific contributions he has been awarded the Order of Labor Red Banner. Orig. art. has: 1 figure. [JPRS]

sequently, he joined the Rostov department of the GPI /Gosudarstvennyy proyektnyy institut; State Designing Institute/ "Tyazhpromelektro-
proyekt" where he advanced from a technician of the designing de-
partment to its chief engineer. From 1933 to 1962 he was docent of
the department of electrification of industrial enterprises of the
NPI /Novocherkasskiy politekhnicheskiy institut imeni Sergo
Ordzhonikidze; Novocherkassk Politechnic Institute im. Sergo
Ordzhonikidze/; he taught as professor until 1965 and presently is
a professor of the RIIZhT. He published more than 70 scientific
works, including studies of flywheel-containing electric motors,
investigations of electrical loads of industrial enterprises,
analyses of basic features of real load graphs, (including their
probabilistic modeling), proposals for peak load calculation methods
(based on the theory of mass servicing) and developments of methods
for the calculation of extremal loads of heavy consumers, for the
study of random graphs of reactive loads, for the evaluation of
electric load fluctuations, and the like. G. M. KAYALOV was also
active in the Party, professional, and scientific organizations.
He is a holder of the "For Outstanding Work During the Great
Patriotic War of 1941-1945 gg." medal and the "Badge of Honor"

decoration. Orig. art. has: 1 figure. [JPRS] 14

TITLE: O. B. Bron (on his 70th birthday)

SOURCE: IVUZ. Elektromekhanika, no. 2, 1966, 235-236

TOPIC TAGS: electric engineering personnel, circuit breaker

ABSTRACT: Osip Borisovich Bron was born in 1896 in Klintsi. In 1920, he graduated from the physics-math faculty of Khar'kov Technological Institute. He became a professor in 1930. He defended his doctor's thesis in 1940. During the second world war, he was in the navy. After demobilization in 1950, Engineer Colonel Bron went to work teaching at the Leningrad Industrial Correspondence School. He became the head of the Chair of Theoretical Bases of Electrical Technology in 1958. He is closely associated with scientific and development work, and has cooperated closely in this area with the Leningrad "Elektrosila" plant since 1946. His work has been in the areas of spark-damping and high-power circuit breakers. He has published over 140 scientific works and 19 inventions. [JPRS]

AUTHORS: Pansevich - Kolyada, V. I., Bogush, B. K. SOV/79-29-4-34/77

TITLE: Investigation of Esters With an Allyl Position of the Double Bond (Issledovaniye prostykh efirov s allil'nym polozheniyem dvoynoy svyazi). IV. Preparation of Some Esters of 2-Methyl-4-benzyl-penten-2-ol-4 and 1-Phenyl-buten-1-ol-3 (IV. Polucheniye nekotorykh prostykh efirov 2-metil-4-benzil-penten-2-ola-4 i 1-fenilbuten-1-ola-3)

PERIODICAL: Zhurnal obshchey khimii, 1959, Vol 29, Nr 4, pp 1198-1201 (USSR)

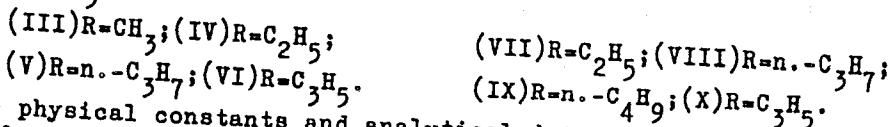

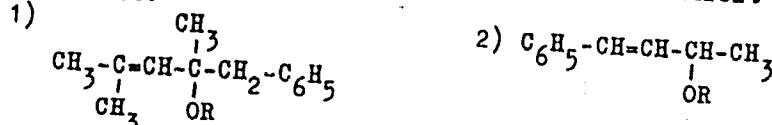

ABSTRACT: In the previous reports (Refs 1-3) published by the authors it was shown that $\alpha,\alpha,\gamma,\gamma$ -tetra-alkyl-substituted allyl alcohols are exceptionally capable of forming esters with primary alcohols in the presence of a small quantity of diluted sulfuric acid. It is known that this formation of esters is also easily possible in the case of some tertiary alcohols containing a phenyl- or styryl radical (Refs 4-14). Therefore it seemed rather obvious to carry out the formation of esters of tetra-substituted allyl alcohols with aryl radicals. In the present article the results of the formation of ester of 2-methyl-4-benzyl-penten-2-ol-4 (I) and 1-phenyl-buten-1-ol-3 (II) with methyl-, ethyl-, n.-propyl-,

n.-butyl-, and allyl alcohol are described. It was found that the alcohol (I) is almost as easily transformed into the ester as the tetra-alkyl-substituted allyl alcohols (Refs 1-3), and that the ester formation of the alcohol (II) is much more difficult, as was noted on an earlier occasion (Ref 1). This different reaction rate in the ester formation of these two alcohols (I) and (II) may only be explained by the different nature of the alcohol groups. The synthesized esters exhibit the following structure:

The physical constants and analytical data are given in the table. Only benzoic acid aldehyde and benzoic acid were found in

the oxidation products of 1-phenyl-3-ethoxy-buten-1 with potassium permanganate. In all, eight esters hitherto unknown were synthesized, all of them with an allyl position of the double bond. There are 1 table and 17 references, 5 of which are Soviet.

Indications for lobectomy are: (1) isolated large cavities in the upper lobe with bronchial stenosis, (2) cavitary processes in the lower lobe with bronchial stenosis following unsuccessful phrenic avulsion, (3) bronchiectatic cavities and chronic suppuration, (4) lobitis following streptomycin failure, (5) tuberculoma (sometimes segmental resection) and (6) cavities refractory to pneumothorax. Indications for pneumonectomy are (1) diffuse cavitation of one lung, (2) the same associated with bronchial stenosis, (3) unilateral bronchiectasis and tb and (4) unsuccessful thoracoplasty.

1813. BOGUSH L. K., GERASIMENKO N. I. and SAVON A. A. Surg. Dept. of the Tuberc. Inst. of the USSR Acad. of Med. Sci., Moscow *Ligation of bronchi in the treatment of pulmonary tuberculosis (Russian text)* Khirurgija 1956, 32/8 (3-7)

Experience of ligation of the bronchi permits the conclusion that it may be one of the new effective surgical treatments of pulmonary tuberculosis. Ligation of the upper bronchi on the right as well as on the left side is performed by a lateral incision under local anaesthesia or general anaesthesia with intubation. When suturing the bronchus it is necessary to take into consideration the possibility of restoration of patency of the bronchial lumen. This method requires further improvement. Of 20 patients operated by ligation of a bronchus one died on the 10th day of a contralateral pneumonia. The isolated ligation of the lower bronchus at the hilus inducing complete atelectasis of the base of the lung is not followed by necrosis of the pulmonary tissue. The operation is better tolerated than pulmonary resection. A definite therapeutic effect of postoperative atelectasis of a part of the lung was observed.

Title : On Afterimages and Some Manifestations of Afterreaction
in Optic Perceptions.

Orig Pub: Nauk. zap. Nauk. desl. in-t psikhol. URSR, 1956,
4, 123-150

Abstract: Afterimages (AI) were investigated in 40 normal
and in more than 100 nervous and psychotic patients,
after 15 sec. of fixation of 1, or 2-3 simple flat
geometrical figures (F) of various colors. Trans-

formation of AI was observed in normal subjects only during the period of their extinction. Transformation resulted basically following perception of several F simultaneously and manifested itself in the confluence and superimposition of one F upon another. The deformation of the AI of a circle was the easiest to occur. The AI of a square was the most stable of all. Following consecutive showing of a series of F the AI of that F occurred which was fixed 2 or 3 times longer than the others. Multiple repetition of one F led to the weakening and disappearance of its AI, the clarity of the optical perception remaining unchanged. AI failed

to appear following perception of a complicated differentiated F or following projection of AI upon a composite surface. In the process of extinction the AI at first lost color then clearness. Marked transformation of AI was observed in patients and in those with schizophrenia; the AI were distorted by strange presentations. The author underlines the role of the central processes in AI and considers them as a manifestation of optical reception at a low level. Experiments with the method of variable "arrangements" demonstrated that a single prolonged fixation of a pair of F differing in size and form, for a period of 20-30 sec., produced in

75 and 47% of experimental subjects (correspondingly) illusions of distinction of a pair of similar F's; prolonged fixation of one F distorted the following perception of F of another size. When the difference of size and form was greater the errors had the character of contrast; when the difference was small - of similarity. Prolonged presentation of F or its brief exposition produced less marked illusions. -- M.I. Lisina

Title : The Phenomena of Interaction of the Visual and Motor
Analysers in the Perception and Production of Movements.

Orig Pub : Vopr. psichologii, 1956, No 3, 48-54

Abstract : Tests were carried out on students. On removal of the visual control, the stability and clarity of the motor concepts about the movements to be performed increases. Unlearned movements are produced most precisely, when the first and the second movements are conducted under visual control; less precise when vision is excluded; and even less precise when the first movement occurs under visual control and the second-without. Author recommends that in teaching motor habits, after their practice under visual control to continue practising them with exclusion of vision. In objective movements the dominance of the visual
