TITLE: A new accurate laboratory rheometer

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 2, 1962, 170, abstract
2Ye26 (Dokl. Bolg. AN, v. 14, no. 3, 1961, 243 - 246)

TEXT: The construction of a laboratory rheometer for measuring the flow rate of a gas over a wide range with high accuracy is described. Increased accuracy is achieved by a considerable increase in the working length of the measuring tube, made in the form of a spiral. This rheometer is notable for its compact form and cuts out possible loss of manometric fluid. [Abstracter's note: Complete translation]

TITLE: Reaction in the solid phase in a mixture of kaolin^{6,44} and calcium carbonate

SOURCE: Sklar a keramik, no. 3, 1965, 87-91

TOPIC TAGS: ceramic, porcelain, kaolin, calcium carbonate, solid phase reaction, reaction mechanism, first endothermic effect, first exothermic effect, kaolinite, limestone, porcelain paste

ABSTRACT: The authors review the results of investigations which have already been made of the ternary system $\text{CaO} - \text{Al}_2\text{O}_3 - \text{SiO}_2$, important for the formation of ceramic pastes with the crystalline component of anorthite, in order to explain the mechanism of anorthite formation. It has been shown that the reaction depends on the dehydration of kaolinite, but the direct product of this reaction has not been determined. Neither has it been established when and how this synthesis proceeds, nor what the connection is between the intermediate phase and anorthite. This study attempts to answer these questions and to explain the reaction between

Card 1/2

L 2251-66

ACCESSION NR: AP5009382

kaolinite and calcium carbonate in the molar ratio of 1:0 to 1:2 in the temperature region of the first endothermic and first exothermic effect of kaolinite. Kaolinite from the region of Stachanovo and limestone from the region of Ogujanovo served as the experimental materials. The limestone was ground in a porcelain mill. Eight mixtures of the components were prepared for studying the reaction between kaolinite and limestone. It is concluded that gehlenite is the first stage to be formed when the experimental mixtures are heated to 600°C; anorthite appears as the first exothermic effect of kaolinite, and the described reaction mechanism is in agreement with the Brindley and Nakahir theory concerning the gradual change of kaolinite into the kaolinite - spinelmullite series. Orig. art. has: 9 tables, 10 figures, and 5 formulas.

The influence of pectin on the coagulation of blood. Jelka Bergant, Vojislav Djimovski, Bojan Drzaj (Univ. Ljubljana, Yugoslavia). *Kem. Zbornik* 1951, 25-9. The influence of pectin and other substances on the coagulation of blood has been studied. The following conclusions were reached: The pectin preps. had no influence on the coagulation of blood. The products of the hydrolysis of pectin shorten the coagulation time by 21.84%; however, the galacturonic acid lactone which is formed has no effect. The Ba salt of 1-methylgalacturonic acid decreases the coagulation time by 34% and digalacturonic acid decreases it by 51%. The dimethyl ester of methylgalacturonic acid decreases the time by 55%.

An investigation is made of the asymptotic behavior

$\int_0^1 f(x) dx$

as $n \rightarrow \infty$. It is shown that if $f(x)$ is a function of bounded variation on $[0, 1]$ and if $f(x) \sim \phi(x)$ as $x \rightarrow 0^+$, where $\phi(x)$ is a function of slow growth increasing to ∞ as $x \rightarrow 0^+$, then $\int_0^1 f(x) dx \sim \int_0^1 \phi(x) dx$ as $n \rightarrow \infty$. The case of a function of bounded variation on $[0, 1]$ and of slow growth increasing to ∞ as $x \rightarrow 0^+$ is also considered.

AUTHOR: Bojanich, R.

TITLE: On the approximation of continuous functions by Bernstejn polynomials

PERIODICAL: Referativnyy zhurnal, Matematika, no. 2, 1962, 17, abstract 2B75. ("Glas. Srpska AN", 1958, 232, 59-65)

TEXT: Let the function $f(x)$ have a continuous derivative $f'(x)$ on $[0, 1]$ with the exception of the point ξ , $0 < \xi < 1$, where it has a discontinuity of the first kind with the jump

$$\sigma = f'(\xi + 0) - f'(\xi - 0) \neq 0.$$

Let $B_n(f, x)$ be the Bernstejn polynomial of f with degree n . Then the following holds for $n \rightarrow \infty$:

$$B_n(f; \xi) - f(\xi) = \left\{ \frac{\xi(1-\xi)}{2\pi} \right\}^{1/2} \frac{\sigma}{\sqrt{n}} + o\left(\frac{1}{\sqrt{n}}\right).$$

The result for $\sigma = 0$ is that of G. G. Lorentz (Bernstein Polynomials, Card. 1/2) ✓

On the approximation of continuous ... S/044/62/000/002/010/092
C111/C222

Toronto, 1953). There are a number of regrettable missprints, among which the splitting of the basic integral is important; for $0 < \delta < 1$ it should read correctly

$$\int_0^{\infty} = \int_0^{\delta} + \int_{\delta}^{\delta^{-1}} + \int_{\delta^{-1}}^{\infty} .$$

BOJANOVIC, Jelena

Distr: 4E2c(3)

Preparation of symmetrical bisamides containing condensed, heterocyclic, and alicyclic rings in the aldehyde group. II. Gjorgje Stefanovic, Jelena Bojanovic, Milanka Corbic, and Mihailo Lj. Mihailovic (Prirodno-mat. fak. Beograd, Yugoslavia). *Glasnik Khim. Društva, Beograd* 22, 29-42(1957); cf. *C.A.* 52, 16350e.—Several new bisamides were synthesized by condensing acetamide (I) and benzamide (II) with various aldehydes contg. heterocyclic and alicyclic rings in the α -position: 3-thenylidene-*N,N'*-bisacetamide, m. 231°; 3-thenylidene-*N,N'*-bisbenzamide, m. 213-14°; 2-pyridylmethylene-*N,N'*-bisbenzamide, m. 211°; 3-pyridylmethylene-*N,N'*-bisbenzamide, m. 210°; and 4-pyridylmethylene-*N,N'*-bisbenzamide, m. 217-18°; 3-pyridylmethylene-*N,N'*-bisacetamide, m. 235-6°; 1-acetyl-3-indolylmethylene-*N,N'*-bisacetamide, m. 267°; 1-acetyl-3-indolylmethylene-*N,N'*-bisbenzamide, m. 254-5°; cyclohexylidene-*N,N'*-bisacetamide, m. 279.5°; cyclohexylidene-*N,N'*-bisbenzamide, m. 250° (decompn.). Condensation of pyrrole-2-carboxaldehyde with I and II did not yield the expected bisamides. The new bisamides were prepd. in 27-99% yield by heating the aldehyde and amide on a water bath in the presence of Ac_2O or by directly heating the starting products without Ac_2O at 150-80°. At the same time a study was made of the effect of heating period on the yield of bisamide in the condensations of aldehydes and acid amides in the presence of Ac_2O . With aliphatic aldehydes it was found that the yields were best after heating the mixt. 3-4 hrs. Cinnamaldehyde behaved similarly whereas with cyclohexanecarboxaldehyde the yields were best after 1.5 hrs. heating. With aromatic aldehydes, however, optimum heating periods were somewhat longer (7-10 hrs.).
