SOV/177-58-4-24/32

AUTHOR: Boyko, A.A., Colonel of the Medical Corps, Candidate of Medical Sciences

TITLE: A New Model of the Apparatus for Disinfecting Water by Bactericidal Rays (Novaya model' apparata dlya obez-zarazhivaniya vody bakteritsidnymi luchami)

PERIODICAL: Voyenno-meditsinskiy zhurnal, 1958, Nr 4, pp 81-86 (USSR)

ABSTRACT: The author reports on his experiments with an improved apparatus for disinfecting water by bactericidal rays. The apparatus is made of stainless steel and is composed of three fundamental parts: the section for irradiating the water, a cloth filter and a starter for lighting the low-pressure bactericidal lamps type BUV. The author sums up the results of his experiments in the following conclusions: 1) the improved ultra-violet installation guarantees disinfection of drinking water, infected by vegetative and cryptogamous kinds

Card 1/2

SOV/177-58-4-24/32

A New Model of the Apparatus for Disinfecting Water by Bactericidal Rays

of bacteria. Seawater can be disinfected independent of the degree of its saltiness; 2) depending on the supposed water consumption, the number of the bactericidal lamps may be reduced or increased; 3) fastening the installation at the water main guarantees automatic water disinfection; 4) the ultraviolet water disinfecting installation can be used on river and sea vessels, in camps and harbors, and at railway stations. There are 2 photos, 2 diagrams, and 5 tables.

**TITLE:** Concrete Factories Employing New Technology (Betonnnye zavody po novoy tekhnologii.)

**PERIODICAL:** Mekhanizatsiya Stroitel'stva, 1958, Nr 5, pp 21-26.

**ABSTRACT:** The Research Organizations Svir'stroy, Kuybyshevgidro-stroy, Narvagesstroy, Gor'kovgesstroy, Giprostremmash and VNIISTroydormash are working on the popularization of the mixing, transporting and casting of reinforced concrete mixes by continuous methods of operation. The technology of these methods is described in detail. The successful tests with vibro-mixing of concrete mixes were carried out in NIK-200 and in VNIITISM. Academician P. A. Rebindin developed a method to improve the quality of the concrete mix and reduce the quantity of cement used. Investigations on the effect of vibration on concrete mix containing coarse aggregate were made by Drs of Technical Sciences A. Ye. Desov and N.V. Mikhaylov. The VNIITISM and the Leningrad Branch of the VNIISTroydormash, Central Constructional Bureau of Glavmosstroy and NIOMTP are working on the construction of machines which prepare concrete mixes at the same time activating them

Card 1/2

## Concreting Factorles Employing New Technology SOV/100-58-5-7/15

and mixing them by means of vibration. Figure 1 illustrates the working principle of a "turbulent" mixer of French manufacture. Various other foreign mixers, e.g. English, American, Czechoslovakian, Austrian and German are described. Figure 2 illustrates the working scheme of a mixer for colloidal mix. A conveyer belt feeder of the Gor'kovgesstroy factory is illustrated in Figure 3. The viscosimetric method of regulation of water content in cement mix is described in an article in Mekhanizatsiya Stroitel'stva, Nr7, 1955 by A.G. Boyko entitled "Concreting Factories with Continuous Production and Automatic Regulation of the Plasticity of Concrete Mix". Figure 9 illustrates the dosing and concrete mixing plant of continuous process design by Giprostrommash with 120m<sup>3</sup> capacity per hour. Table 2 gives technical data of this plant. Table 3 gives values characterizing physical changes of concrete mix and set concrete in limits of  $\pm 3\%$  of sand humidity. Figure 10 illustrates a scheme for automatic regulation of the time of agitation of the concrete mix designed by NIIONTP. There are ten figures and three tables.

SOURCE: Vsesoyuznyy seminar po novoy metodike seysmorazvedki. Seysmorazvedka s primeneniym gruppirovaniya vzryvov na dlinnykh bazakh i sposoba tsentral'nykh luchey (Seismic prospecting using the grouping of shots on long bases and the method of central rays); trudy seminara. Moscow, Izd-vo Nedra, 1965, 84-90

TOPIC TAGS: seismic prospecting, seismic wave, seismography, seismology, underground explosion

ABSTRACT: A description is given of the results of experimental investigations conducted by the central-ray method (STsL). It is shown that this is a reliable and economical way of probing gently sloping structural formations in the presence of reflecting reference horizons, such as the outer zone of the cis-Carpathian trough. In the case of

Card 1/2

ACC NR: AT6028969

the southwestern border of the Russian platform, where reference horizons are absent and angles of inclination are steep, a considerable divergence is observed between the data obtained by STsL, the reflected waves method, and the method of controlled directional reception. This discrepancy requires further compilation of data on the effectiveness of STsL. Orig. art. has: 4 figures.
