Prague, Ceskoslovenska Farmacie, Vol 15, No 8, Oct 66, pp 432-437

Abstract [Authors English summary modified]: 5-phenylisocytosines were prepared by condensation of enoethers of alpha-formylphenyl acetates; these were transformed through nitro-phenyl substances to corresponding aminophenyl derivatives. Reaction of  $P_2S_5$  with 5-phenylisocytosines produced 2-amino-4-mercapto-5-phenylpyrimidines; ethylchloroacetate produced 2-amino-4-ethoxycarbonylmethylthio-5-phenyl-pyrimidines, which were hydrolyzed to free acids. Nitration of the esters produced nitrophenyl derivatives, and their reduction aminophenylesters. The products were tested for pharmaceutical, bacteriological, and virological applications. They show a therapeutic effect in mice who were infected by the influenza A PR-8 virus; the dose used was 1.5 mg per mouse per day. 4 Tables, 4 Western, 4 Czech references. (Manuscript received 23 Apr 66).

Prague, Ceskoslovenska Farmacie, Vol 15, No 9, Nov 66, pp 470-473

Abstract /Authors' English summary modified/: The nature of the crystalline form depends on the solvent and the conditions under which the crystals are formed. Alpha form which has a m.p. at 212°C forms when crystallization occurs from hot solutions under agitation; beta form with a m.p. of 197°C is formed when the crystals are formed in the cold from water solutions. Crystallization from solvents containing alcohols and water produces a mixture of the 2 forms. Infrared spectra of the two forms are different. X-ray spectra are discussed. Beta form can be converted to the alpha form by melting and slow cooling of the melt. 5 Figures, 8 Western, 3 Czech references. (Manuscript received 4 Jul 66).

TITLE : Polarographic Method of Analytic Determination of 1-Diazo-2-Naphthol-4-Sulfonic Acid and 6-Nitro-1-Diazo-2-Naphthol-4-Sulfonic Acid

ORIG. PUB. : Dokl. Bolg. AN, 1958, 11, No 5, 387-390

ABSTRACT : 1-Diazo-2-naphthol-4-sulfonic acid (I) is reduced at dropping Hg-electrode at pH 4.7 (acetate buffer) and pH 9 (ammonia buffer); wave height is proportional to concentration of I, half-wave potential  $E_{1/2} = -0.62$  v. In the presence of  $\text{Na}_3\text{AsO}_3$  the wave of I vanishes. 6-Nitro-1-diazo-2-naphthol-4-sulfonic acid (II) yields at dropping Hg-electrode 2 waves at pH 9. On addition of  $\text{Na}_3\text{AsO}_3$  only one wave is left ( $E_{1/2} = -0.68$  v), the height of which is proportional to concentration of II, but depends greatly on pH of solution. The polarographic method is suitable for separate determination of I and II, and also of II in the presence of I; relative error is  $\pm 2\%$ . -- Yu. Pleskov.

PERIODICAL: Referativnyy byulleten' Bolgarskoy nauchnoy literatury, Khimiya i khimicheskaya tekhnologiya, no. 2, 1962, 8, abstract 110, Doklady BAN, 15, 1962, book 2, pp 155-158 (German, Rus. summary)

TEXT: It was found that during the epoxidation of sulfated lignin in the presence of 49% NaOH, and with simultaneous distilling off the water, (both that produced in reaction and water introduced from outside), a resin is formed which, after removing the epichlorohydrin by distillation under vacuum is converted into a form insoluble in epichlorohydrin and other solvents. During the epoxidation of phenol lignin resin (condensation product of phenol and sulfated lignin) a soluble epoxide resin is formed, with a softening point of 72-95°C. This resin dissolves in ethylene glycol, dioxan, chloroform, and cyclohexane, but is insoluble in CCl<sub>4</sub>, and in aromatic or

aliphatic hydrocarbons. The resin combines with phenol-formaldehyde and diene resins and hardens under the action of aliphatic polyamides and their adducts. The resin may be used for the preparation of varnishes, pastes and glues (Sofia, Bolgarskaya akademiya nauk, Institut organicheskoy khimii (Sofia, Bulgarian Academy of Sciences, Institute of Organic Chemistry)).

Complexometric Method for the Determination  
of Lead

PERIODICAL:

Zavodskaya laboratoriya, 1960, Vol 26, Nr 1, pp 50-51  
(USSR)

ABSTRACT:

The method described is based upon the fact that lead is precipitated in the form of sulfates, dissolved in a mixture of potassium hydroxide and tartaric acid, and titrated with trilon using methyl thymol blue. The use of the alkaline solution causes a swift colour change of the indicator and makes determination in the presence of barium possible. Calcium does not disturb the lead determination and also barium with a 0.2 g weighed portion can be present up to 12-15% as the lead of the precipitate is completely extracted during long boiling. Methyl thymol blue can also be used for titrations in ammoniacal media, in this case, however, e.g. ammonium fluoride has to be added for masking the calcium.

Card 1/2

Complexometric Method for the Determination  
of Lead

S/032/60/026/01/014/052  
B010/B123

If in the latter case larger amounts of silicon are present, the lead is only slowly titrated and the results are reduced. A course of analysis is stated and a comparison of determination results obtained (Table) according to the described method, and of the dichromate method, and shows great conformity. There are 1 table and 1 reference.

TITLE:

Investigation of the Kinetics of Electrochemical Reduction of Chromic Acid on a Rotating Disk Electrode<sup>7</sup>

PERIODICAL:

Doklady Akademii nauk SSSR, 1960, Vol 130, Nr 5, pp 1047-1050 (USSR)

ABSTRACT:

The authors studied the contribution of sulfate ions to the reduction of chromic acid and refer to A.I. Vagramyan (Ref 2). It is supposed that diffusion-dependent complexes are formed in this case. Accordingly, they carried out their experiments under exactly controllable diffusion conditions as may be established by means of a rotating disk electrode (according to Yu.Yu. Matulis and M.A. Mitskus, Ref 4). Reduction was carried out at 10, 25 and 45°. The solution contained 200 g/l of chromic acid and 0.5-8 g/l of H<sub>2</sub>SO<sub>4</sub>. Figure 1 illustrates the dependence of the maximum ~~amperage~~  $i_{max}$  upon  $\sqrt{z}$  (z = number of revolutions of the electrode). With a high z,  $i_{max}$  remains slightly lower as a result of secondary processes than would

correspond to a linear dependence. The equation  $\frac{1}{i} = \frac{1}{i_d} + \frac{1}{i_k}$  is derived ( $i_d$  - the limiting current determined by diffusion only,  $i_k$  - the limiting current determined only by the kinetics of the side reaction). It is noted that  $\frac{1}{i}$  is a linear function of  $z^{-1/2}$  as confirmed by experiments (Fig 2). The dependence of  $i_d$  (with  $z = 1$ ) and  $i_k$  upon the concentration of sulfuric acid was determined from the slope of the straight line (Fig 3). Figure 4 depicts the temperature dependence of  $i_{max}$ . The temperature coefficient  $\frac{1}{i} \frac{di}{dt}$  was found to be 0.019. The restriction of amperage by the diffusion conditions shows that sulfate ions react on the electrode. A.N. Frumkin et al. (Refs 12, 13) are mentioned in this paper. There are 4 figures and 13 references, 6 of which are Soviet. ✓

Title : Statistical Derivation of Kinetic and Diffusionally Limited Kinetic Currents

Orig Pub : Statisticheski izvod na kinetichni i difuzionno ogranicheni kinetichni tokove.

Izv. B'lgar. AN Otd. fiz.-matem. i tekhn. n. Ser. fiz., 1955, 5, 89-106 (Bulgarian; Russian and German summaries)

Abstract : Calculated statistically is the limit current  $i_{(lim)}$  of electrode processes  $A + ne \rightarrow A'$  which are preceded by fast chemical reaction:

cally inactive. It is assumed that: 1) equilibrium concentration A is so low that its diffusion from the solution volume can be disregarded; 2)

1/2

Bulgaria/ Physical Chemistry - Electrochemistry

B-12

Abs Jour : Referat Zhur - Khimiya, No 4, 1957, 11343

decomposition of A is a reaction of first order;  $3\sqrt{\bar{\Delta}^2} \ll \delta$ , where  $\bar{\Delta}$  --mean displacement of molecules A during mean life period  $\tau$ ; and  $\delta$  --effective depth of diffusion layer. Comparison of expression thus obtained  $i_k = nFSc_0^0 \times \sqrt{D_A k_A / K} (i_k$  --kinetic current, S --electrode surface) with previously derived equation (Brdicka R., Wiesner K., Coll. Czech. Chem. Comm., 1947, 12, 39, 138), shows that thickness of reaction layer  $\mu = \sqrt{D\tau}$ . If kinetic  $i_{(lim)}$  depends upon conditions of diffusion  $B_1$  and  $B_2$ , it is called diffusionally limited kinetic current (1). If  $i_{(lim)}$  is limited only by rate of diffusion  $B_1$ , then with  $i_k / i_{B_1} < 0.3$   $i_{(lim)} / i = 1 / i_{B_1} + 1 / i_k$ . With  $i_k / i_{B_1} > 0.3$  there holds the equation  $1 / i = 1 / i_{B_1} + 1 / (1.07i_k)$  (1). These equations are approximately correct also for a drop Hg-electrode, for which

$$\bar{i}_k = 0.51 n F m^{2/3} t^{2/3} c_{B_1}^0 c_{B_2}^0 \sqrt{k_B D_A / K} \text{ and } \bar{i}_{B_1} = 0.627 \times n F m^{2/3} t^{1/3} c_{B_1}^0 D_{B_2}^{1/2}.$$

It is noted that more precise expressions are obtained on taking into account conditions of diffusion  $B_1$  to drop electrode (Meyman N., Zh. fiz. khimii, 1948, 22, 1454; RZhKhim, 1955, 3497). Equation (1) permits ready determination of  $i_k$  and  $i_{B_1}$  by variation of parameters, upon which  $i_k$  and  $i_{B_1}$  depend in different manner, and subsequent extrapolation.

Electrode properties and resistance of glass electrodes made from 11.0% (25%) BaO (8%) glass. R. Roderick, D. Michalova, and B. Penicheva (Univ. Sofia, Bulgaria). *Z. Elektrochem.* 61, 158-62 (1957). — Glass electrodes are prepd. from Li-Ba glass in a manner which completely avoids desulfidation, and their electrode properties and resistance are investigated. The specific cond. of the glass in acid, alkali, controlled conditions, and conditions of manifold are discussed which permit increase of cond. and improvement of electrode properties. The glass electrodes are characterized by a pH dependence which agrees with the theoretical from pH 0 to 11 (error < 0.02) and, in spite of their relative thickness, by a low asymmetry potential and relatively high cond. TITLE:

The Use of a Drop-shaped Mercury Electrode for the Determination of Diffusion Coefficients (Ispol'zovaniye kapel'nogo rtutnogo elektroda dlya opredeleniya koeffitsiyentov diffuzii)

PERIODICAL:

Doklady Akademii nauk SSSR, 1959, Vol 124, Nr 2, pp 342-345 (USSR)

ABSTRACT:

The first part of the present paper deals with the diffusion current limit. Measurement of the diffusion current limiting value of a mercury drop electrode makes it possible to calculate the diffusion coefficient of the substance participating in the electrode process. For this purpose it is, however, necessary to have a sufficiently exact equation for the diffusion current. The equation by Il'kovich is only a rough approximation because, when it was derived, several effects which are characteristic of the mercury drop electrode, were not taken into account. The effects concerned are spherical diffusion, the effect of shielding, the decrease of the concentration of the electrochemically active component in the immediate vicinity of the opening of the capillaries, the influence exercised by capillary pressure, and the

Card 1/3

The Use of a Drop-shaped Mercury Electrode for the  
Determination of Diffusion Coefficients

SOV/20-124-2-29/71

deformation of the drop under the influence of its weight. The curvature of the mercury drop causes an additional increase of the diffusion current by spherical diffusion. The impoverishment of the electrolyte reduces amperage. The three first-mentioned correction factors can be taken into account by one single correction factor to the Il'kovich-equation. Hitherto, all equations for the diffusion current have been derived on the condition that the mercury continues to flow off with constant velocity. However, the flowing-off rate is much lower during the first stages of the life of the mercury drop. Therefore the mean value of the flowing-off rate was used in the equation for the mean diffusion current. A somewhat better approximation can be obtained by calculating the electrode surface in the usual manner from the weight of the drop in the equation for the momentary value, but an approximation equation given by G. S. Smith (Ref 6) for the weight of the drop must be used. In this equation the variation of the flowing-off rate of the mercury is taken into account in the various stages of development of the drop. The second part of the paper deals with the checking of the diffusion current

Card 2/3

The Use of a Drop-shaped Mercury Electrode for the  
Determination of Diffusion Coefficients

SOV/20-124-2-29/71

limit. Investigations were carried out with  $\sim 1.5 \cdot 10^{-3} M$   $PbCl_2$  in 0.1 n KCl + 0.01 % gelatin at  $25^\circ$  in hydrogen atmosphere. The experimental results are shown in a diagram. The value for the diffusion coefficient found in the present paper agrees excellently with the diffusion coefficients of lead ions, which were determined by different methods under the same conditions. There are 1 figure, 1 table, and 8 references, 1 of which is Soviet.

TITLE: Experimental data for establishing the maximum allowable concentration of paraquinonedioxime in the waters of reservoirs

SOURCE: Gigiyena i sanitariya, no. 10, 1964, 15-21

TOPIC TAGS: waste disposal, water pollution, experiment animal, toxicology, quinone, plant parasite

Abstract: The use of paraquinonedioxime in the manufacture of certain types of synthetic rubbers and resins creates an actual problem of contamination of reservoirs by waste waters from such processes. The article gives the results of toxicity determinations of paraquinonedioxime in sub-acute tests with guinea pigs and albino rats and mice as well as its organoleptic effects on water. A concentration of 0.03 mg/kg (0.6 mg/liter) was found to cause no changes whatever in the organs and systems of the test animals. A concentration of 1 mg/liter has no effect on the biochemical consumption of oxygen or the growth of saprophytic microflora and maintains the reservoir waters in satisfactory conditions. The threshold concentrations in

Card 1/2

I 53899-65

ACCESSION NR: AP5017367

terms of water coloring, taste, and odor were found to be 0.1, 0.5 and 1,000 mg/liter respectively. The suggested maximum allowable concentration of paraquinone-dioxins in reservoir waters is 0.1 mg/liter.

Orig. art. has 4 figures.

Institut. :  
Title : Effect of Kuzmicki Bentonite on pH of Water  
and Buffer Solutions.  
Orig. Pub. : Ceskosl. farmac., 1957, 6, No 10, 599-603

Abstract : Addition of 1% of Kuzmicki bentonite (B) to water raises its pH from 6.37 to 8.85, and of 2% to 9.20; each subsequent addition of B brings about a drop of pH until its value becomes stabilized at 7.45 (30% B). B added in amounts of 1-30% to buffer solutions, prepared in accordance with Czechoslovak Pharmacopoeia 2, of pH 1-6, increases their pH, and decreases the pH of buffer solutions of pH > 6. In the above-stated amounts B does not alter the pH of the blood serum of sheep, which makes it possible to utilize Kuzmicki bentonite for removal of proteins, clarification, purification and filtration of some immunobiological preparations. -- A. Vavilova.

**PURPOSE:** This book is intended for the general reader interested in astronomy, celestial mechanics, and astrophysics.

**COVERAGE:** The book presents in popular language and in summary form the most important achievements of science to date in the field of astronomy, celestial mechanics, and astrophysics, and notes the importance of continued progress in these disciplines for space travel to the moon and in our solar system, and ultimately to the nearest stars and galaxies. In the section headed "About the Authors" the degrees and titles, affiliations and scientific contributions of each author are given. The text is accompanied by many diagrams, graphs, and tabular data. There are 37 photographs of various celestial bodies. No personalities

ABSTRACT: A new air terminal with a turnover capacity of 200 passengers per hour has been built at the Leninabad airport, according to the plans of the State Design and Planning Institute of Tadzhikgiprostroy. In addition to specially constructed conveniences for the passengers, the airport has covered gangways from the landing field to the air terminal, so that passengers are protected in various kinds of weather. Ticket registration and baggage checking can be done in the air terminal or on the street. At the end of this year, the construction of an inn for 150 persons and a restaurant will begin. An expansion of the city ticket agency is also planned.

(2)  
Increasing the strength of cement mortars and concretes by adding gypsum and wet regrinding. B. G. SERANTARY AND A. A. BUNINOV. *Stroitel. Prem.*, 29 (8) 19-23 (1951).—Medium-silic type cement with up to 12% C<sub>1</sub>A was used in these tests. The specimens were made of cement and sand (1:3) and 2.5 to 8.5% gypsum. Results were compared with those of specimens having 2.5% gypsum. Crushing strength increased with addition of gypsum, the optimum amount being 7.5%. Similar results were obtained with concretes, the most effective being obtained with water:cement of 0.40:0.35. Wet regrinding of cement with the addition of gypsum increases the crushing strength of concrete considerably in comparison with cement containing 2.5% and more gypsum. B.Z.R.
