TITLE: Steady state flows of an anisotropically conducting medium in a half-space

SOURCE: Prikladnaya matematika i mehanika, v. 30, no. 1, 1966, 154-163

TOPIC TAGS: MHD, compressible flow, steady flow, conductive fluid, plasma

1/25
 ABSTRACT: The steady flow of a conducting fluid over an infinite plane under the action of a uniform magnetic field B_0 is investigated. An assumption is made that the temperature dependence of the physical properties of the fluid is known. As a first approximation, these properties are assumed constant, and a finite solution is obtained in the form

$$V^0 = V_\infty + C_1 e^{i\omega t} + C_2 e^{-i\omega t},$$

$$\gamma_{1,0} = s_{1,0} + i\omega_{1,0} = \frac{1}{2}(R + R_m) \pm \frac{1}{2}\sqrt{(R + R_m)^2 - 4(RR_m - M^2)},$$

where it is shown that the solutions $V^0(y)$, $B^0(y)$, $J^0(y)$ in general have a nonmonotonic characteristic. Next, the wavelength $\lambda = 2\pi/\omega$ is juxtaposed on the

Card 1/2

L 23442-66

ACC NR: AP6007584

velocity profile for $\lambda \ll \delta$. To evaluate the effect of variable properties and compressibility on the flow field, an approximate solution is attempted by means of small perturbations on the various flow parameters. To study the effect of nonmonotonic velocity distribution, the case of a rotating flat plate in an incompressible fluid is analyzed with the magnetic field aligned parallel to the axis of rotation. Orig. art. has: 50 equations and 1 table.

Title : First Cambrian era discoveries in the Dzhagdy ridge (Khabarovsk region)

Periodical : Dokl. AN SSSR, 96, Ed. 4, page 801, June 1954

Abstract : The Cambrian era deposits of the Dzhagdy ridge belong to the Mongol-Okhotsk geosynclinal region, the paleozoic stage of development, which is only recently being explained. The Cambrian era deposits of the Dzhagdy ridge were connected by a general basin with Eastern Zabaikal and South Siberia at the west, and the Ussri basin at the east, where Archaeocyathus sp. of the Cambrian era are known to exist. Cambrian finds were also made recently at the Maloy Khingan. All these finds point toward a broad development of Cambrian transgression in Eastern USSR.

TITLE: Contributions to the Stratigraphy of the Quaternary
Deposits of Central Sikhote-Alin' (Materialy k strati-
grafii chetvertichnykh otlozheniy Srednego Sikhote-
Alinya)

PERIODICAL: V sb: Materialy po chetvertich. geol. i geomorfol.
SSSR, Moscow, Gosgeoltekhnizdat, 1956, pp 76-103

ABSTRACT: The author states that the Far Eastern territory
preserves traces of two glaciations of the mountain-
valley type, and he considers it possible (if general
climatic factors are considered the cause of glacial
formations) to discover parallel glaciation periods
in both the European and Far Eastern parts of the USSR.
He assigns the pre-glacial period and the lower

Card 1/2

Contributions to the Stratigraphy (Cont.)

glaciation to the Lower Quaternary epoch in his tentative outline of the stratigraphy of the Quaternary deposits. He assigns the middle interglacial period and the middle glacial period to the Middle Quaternary, even though acceptable evidence has not yet been uncovered in the southern half of the Far East; however, the nature of the deposits testifies to some climatic cooling. He assigns the upper interglacial period and the last glacial period to the Upper Quaternary. He distinguishes a moment of post-glacial climatic optimum and a modern stage in the present period. The article includes tables of data on spore, pollen, and diatomaceous analyses, and a bibliography of 22 titles.

the Soviet Far East (Optyt geomorfologicheskogo rayo-
nirovaniya yuzhnay chasti sovetskogo Dal'nego Vostoka)

PERIODICAL: V sb: Materialy po chetvertich. geol. i geomorfol.
SSSR, Moscow, Gosgeoltekzdat, 1956, pp 104-128

ABSTRACT: After analyzing existing systems of geomorphological
subdivisions in the southern part of the Soviet Far
East, the author proposes a new system and give a
brief description of its component parts. The article
contains also a geomorphological and an orographical
chart and a chart showing the traces of Quaternary
glaciation. A province, a zone (district) and a region
serve as division units. By a geomorphological

Card 1/4

14-57-7-14549

Geomorphological Subdivision of the Southern Part (Cont.)

province the author means a broad territory lying within a large geotectonic area where a particularly well-expressed type of relief predominates. Geomorphological zones (districts) have similar historical development, occupy similar positions in a geotectonic region and have certain similar features in their reliefs. Such zones lie in geosynclinal areas and are clearly divided due to the zonal distribution of geotectonic elements. A geomorphological zone lies within dissimilar platforms and shields. A geomorphological region represents a territory containing one or several genetic relief types interrelated by a common historical development, geological structure, nature of unconsolidated deposits, signs of recent tectonic movements and geomorphological forms. The author discusses the following geomorphological provinces and zones (districts) together with a number of regions contained in them: A. The Eastern Asiatic geomorphological province of mountains and depressions belonging to the Alpine and Quaternary geotectonic epochs. 1. the Sakhalin zone of horst and graben structures of mountains and

Card 2/4

14-57-7-14549

Geomorphological Subdivision of the Southern Part (Cont.)

depressions. B. The Amur geomorphological province composed of folded and eroded block tectonic mountains and depressions, with folds of the Mesozoic geotectogenetic epoch, augmented by recent tectonic movements. 1. The Sikhote-Alin fold and dome forming an uplift zone. 2. The discontinuous zone of Khanka and Lower Amur Mesozoic-Cenozoic and Cenozoic depressions with numerous complex lacustrine alluvial plains. 3. The Vandano-Amgu zone of eroded tectonic mountains restored by recent tectonic movements. 4. The Khingan-Burein zone of faulted and folded and eroded block tectonic Gault mountains with traces of an ancient glaciation. 5. The Zeya-Selemdzhinsk horst and folded and eroded block tectonic intermountain zone with Gault relief and traces of an ancient glaciation. 6. The Zeya-Udsk zone of Mesozoic-Cenozoic and Cenozoic depressions with numerous plains of lacustrine and fluvial origin. 7. The Dzhugdzhur zone of folded and eroded block tectonic Gault mountains with traces of early glaciation. C. The Aldan geomorphological province of plains of erosion, plateaus and highlands, forming the southeastern Card 3/4

Geomorphological Subdivision of the Southern Part (Cont.) 14-57-7-14549

section of the Siberian Platform. 1. The district of dissected plains of erosion and plateaus at the head of the Aldan River. D. The Zeya-Burein-Amur geomorphological province of plains and eroded tectonic relief. 1. The District of Zeya-Burein-Amur depression. 2. The Turan eroded horst mountain district. A bibliography of 16 titles is included.

AUTHOR: Chemekov, Yu. F.

SOV/20-127-1-50/65

TITLE: Ancient Surfaces of Denudation Levelling in the Priamur'ye (~~Mur~~
Region) and Adjacent Territories (Drevniye poverkhnosti denudatsionnogo
vyravnivaniya Priamur'ya i sopredel'nykh territoriy)PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 127, Nr 1, pp 180-183
(USSR)

ABSTRACT: The author's investigations (Ref 7) showed that the surfaces mentioned in the title are widely developed in the Soviet Far East. They cut the dislocated rocks to a different extent without adapting themselves to the geological structures. The widely distributed weathering crusts are characteristic of it. They form morphologically slightly hilly surfaces with broad river valleys without distinctly marked terraces through which small rivers with not distinctly marked beds flow. The valleys are separated by not too high slightly concave water divides consisting of parent rock. On top of it there are in places residual mountains of a height of 100-300 m with convex or convex-concave slopes which form a volcanello landscape (melkosopochnik). Residual mountains and melkosopochnik consist.

Card 1/3

Ancient Surfaces of Denudation Levelling in the
Priamur'ye (Amur Region) and Adjacent Territories

SOV/20-127-1-50/65

of rocks most resistant to weathering. The levelling surfaces (DLS) are marshy in the Far-East, and their loose covering is often subjected to insular ground frost lasting many years. The DLS developed almost everywhere in this region. Individual regions of the DLS distribution are enumerated. Their description shows that DLS developed in various geological-structural zones: on the plateau (south-eastern part of the Aldan mountain country), in the region of a central massif (Amur-Zeyskaya depression), in the zone of Proterozoic folds (Stanovoy- and Dzhugdzhur chains), in the Mongolo-Okhotskaya and Sikhote-Alinskaya folded regions during the period of relative tectonic staticity. Their age is very different: Cretaceous, Upper Cretaceous, Pre-Upper-Oligocene, Upper Tertiary, Miocene, Pliocene, Pliocene-Lower Quaternary. The different age of their individual sections is characteristic of great DLS. The narrow spatial connection of these formations speaks in favor of the genetic connection between the melkosopochnik, the denudation hills, insular mountains, and the DLS. In the transition from the mountains to the DLS, there exists a rule governing the alternation of landscapes which proves a genetic sequence of denudation types of the relief. This process was interrupted

Card 2/3

Ancient Surfaces of Denudation Levelling in the
Priamur'ye (Amur Region) and Adjacent Territories

SOV/20-127-1-50/65

by the tectonic activity without having reached the peneplain-stage. The typical peneplains lack therefore in the Far East. It must not be spoken of pediplains, since a humid climate existed here. This is confirmed by the spore-pollen-spectra and leaf flora from Jurassic-, Cretaceous-, and Tertiary sediments, furthermore by the kaolin type of weathering. Many useful minerals are connected with the DLS (gold, cassiterite, clay for refractory material and bricks, as well as mineral colors). The almost flat relief is suitable for agriculture. There are 8 Soviet references.

TITLE:

Quaternary Glaciations in the Monsoon Region of the Far East
of the USSR

PERIODICAL:

Doklady Akademii nauk SSSR, 1959, Vol 127, Nr 2, pp 423-426
(USSR)

ABSTRACT:

In most recent years repeated Quaternary glaciations could be detected in the Far East of the USSR. They were synchronous to those of other regions of East Asia and Europe. Their traces were proved in all important mountain ranges and mountain regions of the Far East. This holds also in the case of Mongolia, China, and Japan. Recent glaciers exist only in Kamchatka and in the Himalaya. The mentioned traces are represented either by sculpture- or accumulative relief forms. The following types of geomorphological old glacier landscapes occur in the Far East: (1) Cirque-through-glaciation of deeply and intensively structured mountain ranges, distributed mostly in up to 2500 m high chains. Cirque-, hanging-, simple and complex valley glaciers existed here. (2) Highland glaciation with a semi-cover glaciation (polupokrovnoye oledeneniye)

Card 1/3

Quaternary Glaciations in the Monsoon Region of
the Far East of the USSR

SOV/20-127-2-53/70

(Aldan mountainous country, or at its periphery, at the foot of the Stanovoy range - probably a glacier of the Malaspina type).
(3) Glaciation of table mountains (Kamchatka, Kuril'skiye Islands). Glacier of the Scandinavian type which flew down the river valleys like a snout and formed simple or complex valley glaciers. (4) The glaciation of mountains of volcanic origin (Kamchatka, Kuril Islands) was characterized by a composed glacier complex with a basin which has already existed before (Kal'der glacier), by valley-, radial-, migrating-, cirque- and hanging glaciers, glaciers with broadened end, and glaciers at the foot of the mountain (ledniki podnozhiy) just like the recent glaciation. During the Quaternary glaciation the snow-line showed a considerable depression (Table 1) which increased from the north to the south from 500-700 m to 1400 m. Its position became higher from the north to the south and from the east to the west. This holds also in the case of the direction from the periphery of the mountain ranges towards their axial parts and in the case of the increasing sea level in the same direction, finally in the case of the distance from the sea coast (from the south-east) to the inner part of the continent (to the north-east). The reduction of the snow-line

Card 2/3

Quaternary Glaciations in the Monsoon Region of
the Far East of the USSR

SOV/20-127-2-53/70

(i.e. of the lower boundary of the chionosphere) was assumed to be related to the reduction of the annual temperature average. It is rather certain that the climate of the Far East of that time was a monsoon climate with mainly summer precipitations. The mentioned temperature drop could prolong the cold season of the year and cause the precipitations to fall during the whole year as snow. Table 2 shows the areas computed by the author by means of a planimeter within which remains of Quaternary glaciation are found for the estimation of the intensity of the latter. These areas amount to approximately 60,000 km² for the continental part of the Soviet Far East and to approximately 260,000 km² for Kamchatka. There are 2 tables and 14 Soviet references.

TITLE: The photoelectric properties of single crystals of cadmium selenide treated by gas discharge

SOURCE: Fizika tverdogo tela, v. 6, no. 1, 1964, 128-133

TOPIC TAGS: photoelectric effect, cadmium selenide, cadmium selenide single crystal, gas discharge, photocurrent, spectral distribution, thermal conductivity, fundamental absorption, photosensitivity, dark current, extinction band, capture cross section, hole, electron

ABSTRACT: Measurements were made on single crystals of CdSe grown by recrystallization from the vapor phase. Ga or Ga-In alloy was used to obtain ohmic contacts. The spectral measurements were made with a DMR-4 double monochromator with quartz optics. Before treatment, the dark resistance, the spectral distribution of the photocurrent, the dependence of intrinsic time on wave length of incident light, the spectral dependence of photocurrent yield, and the extinction of photocurrent were measured. The specimens were then subjected to a single treatment of gas

Card 1/2

ACCESSION NR: AP4011749

discharge. After treatment, the same parameters were measured again. It has been shown that this treatment leads to a considerable increase in intrinsic time and in photocurrent yield in deep bands of fundamental absorption because of the marked increase in photosensitivity of CdSe in this band. A large capture cross section for holes results, and a small capture cross section for electrons. Recombination of carriers at the surface is greatly diminished. The yield of electrons at room temperature by neutral vacancies in Se, forming by the gas-discharge treatment, leads to an increase in thermal conductivity. It was observed that the dark current increased. A new extinction band of photocurrent was observed in the vicinity of 7300 Å, forming as a result of treatment on the surface of the crystal. "In conclusion, the authors express their thanks to V. N. Dul'diyer for making some of the measurements." Orig. art. has: 5 figures.

TITLE: Negative photoconductivity of cadmium selenide single crystals treated
in a gas discharge. 27 14

SOURCE: Fizika tverdogo tela, v. 6, no. 12, 1964, 3754-3757

TOPIC TAGS: cadmium selenide, photoconductivity, single crystal, gas discharge,
recombination

ABSTRACT: The negative photoconductivity of discharge-treated CdSe was investigated in the range $\lambda = 720\text{--}750$ nm at room temperature, as well as below and above it [Abstracter's note; temperature not specified]. The resultant negative photoconductivity depended to a considerable extent on the degree of treatment of the crystal. A small dose (1 sec) of additional treatment applied to a sample having maximum negative photoconductivity reduced or even destroyed this photoconductivity. At low temperatures, the negative conductivity was observed after less intense treatment of the crystal than at room temperature. Increase of the temperature above room temperature destroyed the negative photoconductivity com-

Card 1/3

L 20284-65

pletely. The lux-ampere characteristics, recorded for $\lambda = 730$ nm at room temperature after various treatments of a crystal in a gas discharge, were linear before treatment, became sublinear after treatment and, as the duration of the treatment increased, the negative photoconductivity appeared at low illumination intensities. At high illumination intensities, the negative photoconductivity decreased and finally disappeared because of the superposition of the positive photoconductivity. The negative photoconductivity kinetics were investigated in the 710--800 nm region. The positive and negative photoconductivity appeared in all photocurrent rise curves (except for $\lambda = 730$ nm). The rise time constant of the negative photoconductivity was higher than that of the positive. The process of establishing a steady-state value of the photocurrent was slow and could last several minutes. The gas-discharge treatment produced levels with a small electron-capture cross section near the bottom of the conduction band. On illumination with light of energy slightly less than the forbidden band width ($\lambda = 730$ nm), electrons were transferred from the valence band to these levels, while holes were captured by recombination centers and recombined with free electrons. If the recombination of free electrons was faster than the thermal excitation of electrons from the new levels to the conduction band, the number of free carriers decreased, and this gave rise to the negative photoconductivity.

Card 2/3

L 20284-65
ACCESSION NR: AP5000700

The observed increase of the negative photoconductivity on cooling was obviously due to a reduction of the thermal excitation of electrons to the conduction band from the levels formed by the gas-discharge treatment. The observed decrease of the negative photoconductivity at high illumination intensities could be associated with a change in the degree of population of these levels and the recombination levels. TITLE: Generation of electric oscillations in single crystals of cadmium selenide 1

SOURCE: Fizika tverdogo tela, v. 8, no. 10, 1966, 2884-2886

TOPIC TAGS: crystal, cadmium selenide, single crystal, differential resistance, current, gas discharge, volt ampere saturation, low frequency oscillation, oscillation

ABSTRACT: When single cadmium selenide crystals are subjected to a gaseous discharge, the crystals attain volt-ampere saturation and manifest a negative differential resistance. They exhibit low-frequency oscillations in a current whose period depends on the voltage applied, the wavelength, and the intensity of the incident light. Fluctuations in current occur for both direct and alternating voltage applied to the crystals. The author is greatly indebted to S. G. Kalashni-

TITLE: Deformation-induced martensitic transformation in 1Kh15N9S3B steel 44,55

SOURCE: Metallovedeniye i termicheskaya obrabotka metallov, no. 12, 1965, 27-30

TOPIC TAGS: steel, austenitic steel, stainless steel, steel tube, tube rolling, cold-rolling, warm rolling, steel austenite, austenite transformation, martensitic transformation/1Kh15N9S3B steel

ABSTRACT: Cold rolling of 1Kh15N9S3B steel tubes presents serious difficulties owing to the formation of large amounts (60-70%) of martensite. This martensite appears to be the only cause of difficulties since it has been proved experimentally that the steel in fully austenitic condition is not age-hardenable. Tensile tests at 20 to 500C showed that deformation at temperatures below 150C promotes martensitic transformation. The maximum amount of martensite (40-57%) forms with deformation at 20C. Additional annealing at 850C (after annealing at 1100C) intensifies the martensite formation. Annealing of cold-rolled tubes at 450-700C brings about a reversed alpha-to-gamma transformation, but in following cold working, the austenite transforms back into martensite. Examination of a tube section taken from a stopped

IMC: 620.18:669.14.018.8

L 10891-66

ACC NR: AP6000607

cold-rolling mill showed that as the reduction increases from 0 to 38%, the amount of martensite increases from 0.3 to 38% and the hardness, from 235 to 388 HB. At this point, apparently, the temperature of the metal becomes higher than 150C, and no more martensite is formed with a further increase in reduction to 45%. On the basis of the above experiments, "warm" rolling is recommended for 1Kh15N9S3B steel tubes; either the tubes should be preheated to 300-350C before entering the cold-rolling mill, or the mill rolls should be preheated. The rolling should be done without a coolant. [DV]

TITLE: Mastering the production of 1Kh15N9S3B steel pipe

SOURCE: Stal', no. 1, 1965, 49-52

TOPIC TAGS: steel pipe, pipe rolling, austenite steel, martensite steel, stainless steel, stainless steel pipe, steel phase transformation / steel 1Kh15N9S3B

ABSTRACT: Phase transformations of austenite into martensite in 1Kh15N9S3B stainless steel during cold deformation has been taken into consideration in developing the technology of hot-and cold-rolled pipes. The martensite point M_A for the deformation of this steel lies around 150°C and the range of reversal from martensite to austenite is between 500 and 700°C. Mass production of thinwalled 1Kh15N9S3B steel pipe is quite possible if the raw material is free of nonmetallic impurities (nitrides and carbonitrides). The above steel type (-EP302) differs from 1Kh18NiOT by having a 3% lower Cr content substituted by 3% Si. It shows interesting proper-

Cord 1/2

L 30055-55

ties: thus, its ductility changes during hot deformation and the breakdown of unstable austenite into martensite takes place during cold deformation. Tests on the hot rolling of forged 90 mm diameter billets are described in great detail. Great accumulations of nitrides were observed. Cut-out samples were subjected to tensile strength tests at various temperatures and the content of the ferro-magnetic alpha-phase was determined. On the basis of these tests, the following procedure was recommended: first passes of cold rolling are to be done at 150°C. Ready pipes are heat treated at 1050-1100°C. This steel has a tendency to be hardened considerably by cold working but heat treatment later removes this hardness nearly completely. Despite martensite formation, cold rolling was satisfactory up to 60% deformation. Cold drawing was also satisfactory except for cracks where there was considerable accumulation of nitride impurities. "G. N. Syusin and B. M. Kuanatsav participated in the work." ORG: Pervoural'sk New-Tube Plant (Pervoural'skiy novotrubnyy zavod)

TITLE: Manufacture of tubes from EI-711 steel

SOURCE: Stal', no. 1, 1967, 70-72

TOPIC TAGS: metal tube, chromium manganese nickel steel, titanium containing steel, tensile strength, yield stress, elongation /EI-711 steel

ABSTRACT: EI-711 steel (Kh14G14N3T) has been substituted for Kh18N10T steel (AISI-321) in tube production at the Pervoural'sk New-Tube plant. Tube blanks, 50 mm in diameter and 250 mm long, are heated up to 1100, 1150 or 1180°C and pierced into shell cases 50 mm in diameter and 500—550 mm long, with a 6.5 mm wall thickness. Shell cases heated up to 1180°C before piercing have the best interior surface. The shell cases are hot rolled to 83 x 6.5 mm, warm-rolled (at 100—150°C) to 32 x 2.7 mm, cold-rolled to 18 x 0.9 mm, and finally cold-drawn into 10 x 1.0 mm tubes. The mechanical properties of finished tubes in the heat-treated condition were: tensile strength 75—78 kg/mm², yield strength 37—43 kg/mm², and elongation 44—56%. Orig. art. has: 2 figures and 2 tables.

TITLE: Dispersive acceleration of radical polymerization	7.44.55	
SOURCE: Ukrainskiy khimicheskiy zhurnal, v. 31, no. 10, 1965, 1071-1073		
TOPIC TAGS: radical polymerization, vibration effect, polymethyl methacrylate, hydrogen bonding		
ABSTRACT: The dispersive acceleration of radical polymerization of vinyl monomers was studied during the vibration milling of montmorillonite. Cause of the acceleration is a facilitation of the radical decomposition of the adsorbed initiator under the influence of the impact loads. A rise in temperature decreases the effectiveness of the phenomenon as a result of a decreased adsorption of the initiator (benzoyl peroxide) and an acceleration of its decomposition in the homogeneous phase. When montmorillonite is dispersed in a medium of vinyl monomers, no chemical grafting of the polymer to the solid surface takes place. Polymethyl methacrylate, not extractable with boiling benzene, forms as a result of the binding of its macromolecules to the hydroxyl-containing surface of montmorillonite by hydrogen-bond forces. A lowering of temperature promotes the formation of bound polymethyl methacrylate, since under these conditions a larger amount of polymer is formed in the immediate vicinity of the solid surface. TITLE: Automatic wide-band wavemeter for the microwave region

SOURCE: Izmeritel'naya tekhnika, no. 9, 1965, 47-49

TOPIC TAGS: frequency meter, centimeter wave, microwave detector, wideband detection

ABSTRACT: A description is given of a wavemeter developed both for continuous visual observation of the frequency spectrum of a generator of up to 200 Mc at $\lambda = 2.9$ cm and up to 900 Mc at $\lambda = 3.8$ cm and for the measurement of preliminary power distribution with respect to the spectrum of generated frequencies. It can also be used as a sensitive detector for the adjustment and testing of shf instruments. The operation of the device is based on the method of successive analysis by a passive filter in the form of a toroidal resonator. The electrical portion of the instrument is a two-stage amplifier using one 6N9S tube and a trigger using one 6N8S tube for shaping negative quenching pulses. Separate shifters are provided for controlling the scanning voltage and the quenching pulses. The sensitivity of the instrument is no lower than 100 μ V, and its resolution, which is determined by the Q of the resonator, is no higher than 40 Mc. Orig. art. has: 3 figures.
