Chybowski B. Pressure Distribution in Water Pump Heating Equipments.
"Układ ciśnienia w zbiornikach ogrzewania wodnych i pompowych". Gaz,
Woda i Technika Sanitarna, No. 11, 1954, pp. 333-336, 6 figs.

MN

A description of conditions relating to pressure distribution, on which the correct functioning of central heating systems depends. On the basis of an example, the author discusses the pressure changes taking place in a pump system, together with pressure distribution in water pump heating equipment, operating under atmospheric pressure for the following kinds of central heating systems: — with inferior distribution and pump on the return or supply main, with overhead distribution and pump on the return or supply main, ceiling central systems with hot water conduits in the cellar, return mains in the attic, and a pump on the supply main.

AUTHORS: Chybowski, Sylwester, Erikson, Aleksander

TITLE: Preparation of adipic acid by the method of nitric acid oxidation of cyclohexanol

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 2, 1963, 403; abstract 2N34 (Polish patent 45307, Dec. 27, 1961)

TEXT: 98%- solution of cyclohexanol (I) in glacial CH_3COOH and 40-60% HNO_3 are continuously introduced into a reactor (RT); the reacting mass flows into a 2nd RT which is continuously supplied with a solution of I in the glacial CH_3COOH . At the same time air is sent through bubblers into both of the RT. The mass drains into a heater where the oxidation of I is completed, then into a crystallizer where the adipic acid (II) separates out. The suspension of II- crystals is fed into a filter system where II is filtered, washed and directed into a desicoator. The filtrate, containing 25-40% of HNO_3 and 8% of II, is first fed into

Card 1/2

S/081/63/000/002/054/088
B171/B102

absorbing columns, where its HNO_3 content is increased to 45-60%, then returned into the manufacturing process. The temperature is maintained at 60-90°C in both of the RT, at 70-90°C in the heater, and at 15-20°C in the crystallizer. The yield is ~80%. A similar example is given by describing the preparation of II by oxidation of I in the presence of V-Cu- oxidation catalyst (yield of 99.9%-II is ~90%). A flow sheet is given. The method ensures a practically complete utilization of HNO_3 , and of oxides of N and II contained in mother liquors. [Abstracter's note: Complete translation.]

of Alcohols from Primary Nitroparaffins and
Formaldehyde.
Orig. Pub. : Roczn. chem., 1957, 31, No 2, 695-698

Abstract : An improvement of the method of producing nitro-alcohols by the action of formaldehyde on primary nitro-paraffins (Wyler J.A., U.S.Patent 2 164 440, 1938; Fieser L.F., Gates M., J. Amer. Chem. Soc., 1946, 68, 2249). The improved method has made it possible to obtain purer products (without additional crystallization) with higher yields than hitherto. To a solution of 6.01 g paraformaldehyde in 10 ml n-butanol, added 0.5 ml $(C_2H_3)_3N$ followed by 7.5 g nitroethanol. After completion of exothermic reaction and cooling to about 20° there is obtained 2-methyl-2-nitropropanediol-1,3, yield 92%, MP 135-139°. Analogously were prepared

AUTHOR: Chyliński, Z.

TITLE: Semiclassical investigation of multiple meson production as a bremsstrahlung process in high-energy nucleon-nucleon collision

PERIODICAL: Referativnyy zhurnal, Fizika, no. 8, 1962, 29, abstract 8B206 ("Rept. Inst. badań jądrow. PAN", 1961, no. 251/VI, 26 pp., illust., English; summaries in Polish and Russian)

TEXT: In contrast to the well-known theory of Heitler and Peng (W. Heitler and H. W. Peng "Proc. Roy. Irish Acad.", 1943, v. 49, 101), the pi-mesonic field is assumed to be scalar, and the pi-meson production cross section is determined from the difference of peripheral mesonic fields of nucleons prior to and after their collision. It is maintained that the scalar theory describes the πN interactions well at very high energies. The kinematic relations of the theory are examined at length. A cut-off (minimum parameter of impact) is introduced to obtain physically reasonable results. At an increase of energy the mean number of nascent particles tends toward a constant limit. At this point the theory

Card 1/2

Semiclassical investigation of...

S/058/62/000/008/014/134
A061/A101

diverges substantially from the statistical theories, in which the mean number of particles grows as $E_{\text{lab}}^{1/4}$. The angular distribution of nascent particles in the center-of-mass system, as well as in the two-center theory, has a double-humped character. This fits experimental data at very high energies. The transverse-momentum distribution of the particles depends on energy very slightly. The calculation results depend on some parameters selected from comparison with experimental data.

TITLE: Contactless optimum controller

SOURCE: Avtomatyka, no. 4, 1964, 75-79

TOPIC TAGS: automatic control, automatic control design, automatic control system, automatic control theory, optimum controller

ABSTRACT: These major units and their functions (see Enclosure 1) of the contactless optimum controller are briefly described: blocking oscillator 1 controlling a pulse distributor; delay devices 2 and 3 controlled by blocking oscillator 4; reactive trigger 5 acting as a time relay; comparison unit 6 which controls, via an amplifier, trigger 7, the latter controlling, via i_1 and i_2 , — and, if necessary, reversing — the windings of a magnetic amplifier; a final control element designed with a magnetic amplifier from DUND-05. A simplified
