Use of the Heat Conduction of Gases

Orig Pub : Slatoproudý obzor, 1957, 18, No 6, 407-412

Abstract : Description of a vacuum meter of the Pirani system for pressures from 1 to 760 mm mercury with mixing of air in the bulb. The heat balance is calculated with allowance for the mixing of the air, depending on the construction of the bulb. A heater for the apparatus has also been designed.

TITLE:

A model of an annular cyclotron

PERIODICAL:

Jaderná energie, no. 4, 1961, 136 - 137

TEXT: This is a translation of an Russian article entitled "Model' kol'tsevogo fazotrona" (Model of an Annular Cyclotron) originally published in the Soviet periodical "Atomnaya energiya", 9, (1960), no. 12, pp 491-493. It deals with the model of an annular cyclotron which is a fixed-field, alternating-gradient accelerator, built by Soviet and Czechoslovak physicists at the United Institute of Nuclear Research in Dubna. The proposal for an annular cyclotron was made for the first time in 1953 by A.A. Kolomenskiy, V.A. Petukhov and M.S. Rabinovich (Ref 1: Nekotoryye voprosy teorii i tsiklicheskikh uskoriteley (Some Problems of the Theory of Cyclic Accelerators), AN SSSR, 1955; Pribory i technika experimenta (1956), no. 2, p. 26). The elec-

Magnet of the accelerator consists of eight similar, alternately reserved parts, each of which has two sectors with opposite orientation of the magnetic field, and two straight sections. The accelerator is used for electron acceleration. Electrons with energies of 20-40 kev can be injected either continuously or in pulses. Using a combination of eddy and radio-frequency fields, a beam energy up to 2MEV can be obtained with this model. Preliminary results obtained during test runs have shown the high accuracy of the machine and the great stability of its principal magnetic characteristics. Also, in agreement with the theory, a number of various resonances was observed which have a substantial influence on the intensity of the accelerated beam. There are 2 figures and 7 references: 4 Soviet-bloc and 3 non-Soviet-bloc. The references to the English-language publications read as follows: K. Symon, Phys. Rev. 98 (1952), 1152; T. Okawa, Rev. TITLE: Conditions for the origin of Vavilov-Cerenkov and transient radiation

SOURCE: Czechoslovak fizicheskiy zhurnal, v. 15, no. 4, 1965, 225-235

TOPIC TAGS: Cerenkov radiation, Vavilov Cerenkov radiation, transient radiation,
charged particle

ABSTRACT: Attention is drawn to the connection between the virtual parameters and the physical effects produced during the rapid motion of a charged particle in a mass medium. In particular, the virtual position of a particle and its virtual velocity as a function of the real velocity of the particle and the position of the observer are investigated. On the basis of such a study it was possible to formulate a new method for the interpretation of the basic properties of Vavilov-Cerenkov and transient radiation. This method can be used in a simple manner to determine the conditions for the occurrence and the directional characteristics of Vavilov-Cerenkov radiation in both a homogeneous and an inhomogeneous medium. A study of the virtual parameters of a particle on the interface between two optics of differ-

"Clinical Considerations on the Diagnosis and Treatment of Accidents Involving the Swallowing of Caustic Substances."

Bucharest, Revista Sanitara Militara, Vol 17, No 1, Jan-Feb 66.
pp 57-64.

Abstract: After a brief summary of the pertinent statistics and the presentation of some case histories, the authors discuss the diagnosis, clinical evolution and therapy of accidents arising from the swallowing of caustic substances. The importance of preventive measures in all places where caustic substances are used as well as of correct first aid procedures is stressed.

TITLE: Characteristics of sea-water cooled condensing steam turbines

SOURCE: Constructia de masini, no. 2, 1966, 93-101

TOPIC TAGS: steam turbine, turbine cooling, sea water corrosion, corrosion resistant alloy

ABSTRACT:

The author analyzes the chief reasons for the corrosion damage to cooling devices on sea-water-cooled condensing turbines and discusses means of minimizing such damage, particularly those applicable in the work of the Resita Works. Among the measures suggested are proper choice of dimensions for the parts, use of corrosion resistant materials (particularly Cu-Ni alloys), and use of corrosion-resistant coatings. 50. Incrustation in crystal strikes, by M. Cirkus ("Cukorpar" - Sugar Industry - Vol. III, No. 6, p. 142, June, 1950)																											
<p>In mid-October of 1949, at the Szolnok sugar plant a black-grey dark brown coloured lamellar incrustation appeared in the crystal strikes. According to chemical analysis this incrustation consisted chiefly of calcium pectinate with some calcium carbonate, calcium soap and calcium sulphate impeded. The amount of incrustation decreased when the beet pulp was boiled thinner than usual, but its formation was not entirely inhibited. The cause of incrustation was most probably due to diffusion operations. On the one hand, a 12- to 12.5 per cent juice draw-off was applied since mid-October in order to avoid extraction losses and on the other hand, the temperature was often raised to 82°C. For attaining a more rapid diffusion the beet slices were slightly lined at the steaming machines. It is possible, therefore, that the pectic substances contained in beets dissolved in the diffusion battery and entered into the sugar solutions in the form of calcium pectinates. Since incrustation dissolved readily at alkalies, the problem was resolved by drawing into the vacuum pan a sufficient amount of a 60 per cent soda lye immediately prior to grain formation - to obtain a pH value of 11.0.</p>

"Spread of Streptococcal Sore Throat through Food"

Belgrade, Narodno zdravlje, Vol 21, No 10, 1965, pp 281-289

Abstract [Authors' English summary modified]: In July 1964, there was a sudden outbreak of alimentary sore throat epidemic. Out of 126 exposed persons, 68(54%) were taken ill in the course of five days, the period during which the epidemic lasted. Beta-haemolytic streptococcus (BHS) of the group A, type A-10 and A-12 was isolated from the throat of the patients. The epidemic occurred as a result of infected cottage cheese, prepared at a farmhouse and sold in the market. To check the role of the cheese in transmitting the infection under existing conditions, a laboratory experiment was carried out which confirmed the possibility of the infection transmission through this kind of cheese. The clinical picture was clearly defined. There was no trace of early or late complications, this being assigned to the prompt therapy applied to the sick and depo-penicillin protection of the healthy. Tables and graphs. 9 Eastern European, 13 Western references.

"Purulent Meningitis in Rhinorrhoea"

Belgrade, Srpski arhiv za celokupno lekarstvo, Vol 93, No 10, Oct 1965, pp 937-941

Abstract: Five cases are presented in which meningitis recurred from one to nine times in the course of eight years. They were successfully treated with antibiotics and sulfonamides. It was established for cases with recurrent attacks of pneumococcal meningitis that there is a great probability of the existence of fistular communication which enables the entrance of microorganisms into the subarachnoidal area. Although antibiotics help the patients, they do not provide protection from renewed attacks. Only surgical intervention ensures a definite cure. 13 Western references. German summary. ✓ Constructional Materials Resistant to Brines. Josip Cirić
(Zelina Materials, 1954, 2, 291-302; C. A., 1955, 46,
10154).—A comprehensive article dealing with the influence
of NaCl brines of various concentrations upon a large number
of pure metals and alloys, and also non-metallic materials, at
various temp. There is a general discussion on the elec.
conductivity imparted to water by the presence of NaCl, and
the action of local electrolytic cells brought about by the
presence of NaCl. In the experiments described, the influence
of pH, aeration, time, dimensions of the surfaces, and presence
of CaCl₂, are discussed. Corrosion inhibitors, such as Na
silicate, Na₂CO₃, and Na₂PO₄, are mentioned, and protective
coatings are briefly discussed.

One type of lithogenous soil in East Serbia, Milivoje
Ciric (Farmer, Zemun, Yugoslavia) (English summary). These soils are black,
not an account of their humus content which is low (0.97-
5.44%), but because they contain so many of the primary
minerals, especially the iron-magnesium silicates. How-
ever, FeTiO_3 is absent. In the 1st stage of development, the
soils contain 50% SiO_2 and 22% FeO_2 , just as the substra-
tum; as development progresses, both SiO_2 and FeO_2 in-
crease. These black soils are neutral and the satn. with
bases is high, as in such dry climate it is impossible for an
exchange complex to develop. Thus, these soils are similar
to the ones called "Erbibussoil" in Germany and "soil
guy" and "Black Cotton Soil" in India. W. Jacobson

DIRIC, MILANO

The characteristics of the podzolization of the soils in

Serbia. Mihajlo Čirić (Sandžak, Yugoslavia). Jugosloven. Državni Preduzeće Zemljodelja No. 29, 91 pp. (1950) (English summary). Data are given on granulometric composition, hydrolytic activity, total adsorbed bases, pH in H₂O and in KCl soln., SiO₂, Al₂O₃, Fe₂O₃, MgO, Na₂O, and K₂O of Serbian podzols. These soils do not form "crude humus," which is the main source of the fulvic acids and is the principal characteristic of podzolization in northern countries. Serbian soils decompose mainly under the influence of CO₂ and some tannic acid from the *Quercus* species in which these soils abound. Al₂O₃ migrates together with silicates, not as a complex of fulvic acid. Fe can migrate only if reduced to Fe(II); this reduction can occur if there is a stagnation of surplus water. The ratio SiO₂/Al₂O₃ is constant throughout the Serbian podzols. Serbian podzols contain more Al and Fe and less humus than do northern podzols and have higher pH (5.20-5.50). 113 references.

Orig Pub : Veterin. glasnik, 1957, 11, No 8, 752-760

Abstract : A feverish condition, bleeding from all mucous membranes and skin hemorrhaging were basic symptoms. There were noted: thrombo-cytopenia, increase of the coagulation time of the blood, depression of the formation of thromboplastin, increase of the quantity of alpha and beta globulins and decrease of the quantity of the gamma globulin. The illness proceeded into an acute (death in 1 - 2 days) or subacute form. In the latter case, hemor-

"Practical Experience in the Treatment of the 'Nervous Form' of Distemper."

Belgrade, Veterinarski Glasnik, Vol 17, No 6, 1963, pp 547-549.

Abstract: /Author's German summary modified/ Treatment depends on duration, localization, seriousness of clinical manifestations, age, temperament, etc. in the individual case. Treatment of psychic changes at the onset of the disease usually succeeds. Disturbances in sensibility linked to deeper changes in the central nervous system are incurable in most cases.

Eleven recent references, mainly German.
