AUTHOR: Deschcherevskiy, V. I.; Korniyenko, I. A.

TITLE: The influence of heavy water on the vital stainability and thermal stability of skeletal frog muscles

SOURCE: Biofizika, v. 9, no. 3, 1964, 315-320

TOPIC TAGS: heavy water, heavy water induced disturbance, contractability inhibition, vital stain, vital stainability, deuterium, intracellular structure stability, thermal contractive resistance, protoplasmic colloid, actomyosin, cell wall lipid

ABSTRACT: In a preliminary study of functional disturbances caused by D₂O the authors had found increased excitability of the frog sartorius muscle and inhibition of contractability. This pointed towards paraneurosis of the protoplasm which had earlier been shown to be accompanied by increased sorption of vital dyes. The stainability was used for determining the cytoplasmic state in the isolated frog sartorius. Neutral red in Ringer solution containing 50 or 95% D₂O served as the dye for the right muscle, the left serving as control. It was then extracted and the amount determined colorimetrically. Results are tabulated for controls and

Cont'd 1/3

ACCESSION NR: AP4038936

the 2 Deuterium solutions. D₂O decreased rather than increased stainability, i.e. increased the stability of the intracellular structure. This was also reflected in thermal resistance of the contractive muscle structures. At a 1.3 C increase/min. thermal contractability in the 95% D₂ containing Ringer solution, while essentially of the same nature, appeared at an average 5.6 C higher temperature. Tests at a constant temperature of 38 C which lies between that of muscle contraction in light (35 C) and heavy water (41) showed that exchange of the initial light by heavy water led to interruption of the initial contraction after about 60 sec. Upon reversing this test, the D₂ effect disappeared after about 90 sec. This increased thermal stability is apparently caused by the weakening of all hydrogen bonds except those of the water molecule, i.e. depends upon the different nature of the solvent. Decreased sorption may be explained by the decrease of the number of free charges at the protoplasmic colloids capable of binding the dye, loss of contractability by hyperstabilization of the actomyosin complex (increase of hydrophobic interaction) and injury to the cell wall lipids. Orig. art. has: 2 figures and 4 tables.

TITLE:

Grapho-Analytical Research of Optical Layouts of
Electric Meters

PERIODICAL:

Izvestiya vysshikh uchebnykh zavedeniy - priborostroy-
eniye, 1959, Nr 2, pp 119-126 (USSR)

ABSTRACT:

This work has been performed by a group of co-workers of the Chair of Descriptive Geometry and Graphics at the Leningrad Military Mechanical Institute and Leningrad Plant "Vibrator". High-sensitivity electric meters, micro-ammeters, galvanometers, etc, manufactured by the plant "Vibrator", are provided with conical or flat dials with graduations located respectively on the conical surface or parallel one to another. The light-image of the index (slot) falls on the dial in the form of a thin line. It occurs in some devices that at the dial ends considerable inclinations of light-index to the dial graduation take place, which diminishes the accuracy of reading. Experience has shown that these inclinations are ✓

Card 1/3

SOV/146-59-2-18/23

Grapho-Analytical Research of Optical Layouts of Electric Meters

caused by the wrong constructions of optical mirror layouts. To remedy the situation, methods of descriptive geometry and grapho-analysis were applied. Figs 1 and 2 illustrate the mutual placement of a conical dial and the plane of light in electric meters, while Fig 3 shows location of a flat dial in respect of the plane of light. For a regular and precise performance of meters, it is necessary for the index image to coincide with the scale divisions along the whole length of the dial. This is attained when the vertical trace P_{1v} (Fig 1) makes with the axis of projection Ox an angle α_3 determined by formula $\alpha_3 = 90^\circ + \omega = 90^\circ + 2\varphi$, where φ - is the angle between the mirrors 7 and 8 located behind the rotating mirror 6. The horizontal trace P_{1H} forms with the axis Ox an angle α_4 which can be computed according to formula $\operatorname{tg} \alpha_4 = \operatorname{tg} \alpha_2 \cdot \sin \alpha_3$ where α_2 and α_3 are respective angles between the axis Ox and the traces P_{1v} and P_{1H} . Recommended by the ✓

TITLE:
Semi-Industrial Tests on High Purity Zinc Production
PERIODICAL:
Tsvetnoye metallo, 1959, Nr 11, pp73-79 (USSR)

ABSTRACT:
Experiments have been carried out by VNIIMZ's establishment in order to test a method of electrolytic refining of zinc from a pilot plant of the "Uralkal" establishment. After treatment of zinc in a zinc sulphate electrolyte, purifying the latter in two stages. The electrolyte was kept cool by aluminium pipes covered with bakelite varnish. The cathode metal was deposited on to bare zinc cathodes. The 320 x 400 mm. The cathodes were first ground and polished until a mirror finish was obtained. After double treatment their thickness was 5 mm. The anodes, 27 kg in weight, were cast in special cast iron moulds. These anodes were placed in the bath which was covered with a double layer of Phenolvaryl fabric. The original electrolyte was made by two methods with a two-stage purification:

- 1) by dissolving acid sulphate "Koch" zinc salt in distilled water; 2) by dissolving metallic Zn⁰ zinc filings in sulphuric acid solution. The zinc concentration in the electrolyte was not less than 97 to 100 g/L. The following were used for the purification of the electrolyte: zinc dust from the Bulnovsky Plant, zinc oxide "Gidra" in the form of a 1% solution, dried dichromate-anhydrite as a 2% solution, and the activated charcoal "Kadm". Electrolysis was carried out under the following conditions: current density - 800 to 600 A/m²; rate of circulation - 36 to 61 m³/ton of cathode zinc; duration of electrolysis - 5 to 10 hours. The purity of the zinc obtained at the cathode was 93.93%. Following conditions have been found to ensure the best results in the pilot plant operating at present:

current density - 700 A/m²
less than 45 m³/ton cathode zinc; rate of circulation not
electrolysis not more than 6 to 7 hours.

TITLE: Effect of additions on the thermoelectric characteristics of lead selenide

SOURCE: AN SSSR. Energeticheskiy institut. Ispol'zovaniye solnechnoy energii
v narodnom khozyaystve SSSR (Use of solar energy in the economy of the
U.S.S.R.). Moscow, Izd-vo, Nauka, 1965, 19-22

TOPIC TAGS: lead selenide, lead selenide thermoelectric converter

ABSTRACT: The results of an experimental investigation of the effect of Cu and
Zn additions and stoichiometric composition of Se and Pb upon the thermoelectric
characteristics of PbSe are reported. It is found that: (1) These alloys have the
best mechanical characteristics: (a) for the negative branch of thermoelectric
converters, 27.5% Se + 72.5% Pb; (b) for the positive branch, 29.3% Se + 70.7%
Pb; (2) Optimal additions of Cu and Zn are: for p-type alloy, 0.22% Cu; for

TITLE: Defense under nighttime conditions

SOURCE: Voyennyy vestnik, no. 12, 1965, 20-25

TOPIC TAGS: military operation, night defense, nuclear defensive training, defense tactic

ABSTRACT: In a modern war the value of nighttime operations has increased so much in connection with the use of nuclear and other modern weapons that they have become commonplace. At nighttime it is easy to achieve a surprise attack, to cover one's operations from the enemy. Despite the fact that means of nighttime viewing, illumination, and radar have become widely used, darkness substantially limits the possibilities of reconnaissance, hampers the selection of objects for the use of nuclear weapons and aviation, and reduces the effectiveness of fire power. Poor visibility complicates orientation and observation, control, maneuvering and cooperation and leads to a decrease in the accuracy of fire power. The blinding effect of the outburst of a nuclear explosion markedly increases at night. Therefore troop commanders must lessen the effect of the unfavorable factors on the military operations of small units and daringly use the advantages created by darkness. Defensive troops must

Card 1/2

L 07555-67
ACC NR: AP6013408

solve the same problems at night as during the day. However there are peculiarities in their operations which must be taken into account. This article describes a night-time military operation by a commander and his company. The example given confirms that with proper training troops can defend at night just as successfully as during the day. In concluding, the author mentions the changeover from night operations to daytime operations. If a company takes up a defensive position before nightfall, then the company is of course prepared primarily for daytime fighting, and additional measures are taken to secure the defenses at night. Therefore, there is no need to take any special measures when dawn comes. It is a different matter when a company changes over to defense at night, since in this case it is necessary to make changes in the fire system at dawn. Orig. art. has: 2 figures.

TITLE:	Determining the rheological characteristics of raw slurries and suspensions required for calculating hydrotransporting systems			
SOURCE:	Tsement, no. 4, 1965, 7-9			
TOPIC TAGS:	transport process, pipe flow, construction material / RV-8 rotational viscosimeter			
ABSTRACT:	The study of plastic and strength properties of raw slurries presents the possibility of controlling the measurement of their structural composition. A series of tests revealed that laminar flow is most economical for suspensions of high concentration flow characterized by low relative velocities. The use of the RV-8 rotational viscosimeter is discussed and evaluated in the light of tests involving cement products. It is stated that the accuracy of measurement with the RV-8 decreases with increasing concentration of suspensions. Data showing the effective viscosities of argillaceous and chalk suspensions of the Belgorod Cement Factory are shown for the purpose of comparing the RV-8 measurements with Card 1/2			

I. 65286-65

ACCESSION NR: AP5019727

3

those obtained through the use of head loss curves in pipes of selected diameters. The quantitative characteristics of the mechanical properties of suspensions were determined according to the head loss relationship, $I = f(V)$ with the use of both commercial and laboratory pipes. The results of the tests are shown graphically. The working equation of the curves is

$$P = f(V),$$

where $P = \Delta P R / 2 l$, and $V = Q / \pi R^2$. P is the tangential stress at the pipe wall in dynes/cm²; ΔP is the pressure drop; V is the velocity gradient at the same points; R is the pipe radius (cm); and Q is the suspension flow volume (cm³/sec). The authors recommend that the data presented be applied to commercial applications of transporting suspended solids. Orig. art. has 11 tables and 1 figure.

TITLE: The Conditions of the Horizontal Visibility Deterioration at Snowfalls and Snowstorms in the Airport of Nikolayevsk-on-Amur

PERIODICAL: Tr. Dal'nevost. n.i.gidrometeorol. in-ta, 1959, No. 5, pp. 180-183

TEXT: The analysis of observation materials on the horizontal visibility over Nikolayevsk-on-Amur at snowfalls and snowstorms made it possible to state the following aspects which may be used for meteorological servicing the aviation over this district. 1) Lower snowstorms are not an essential factor in deterioration of visibility. The horizontal visibility exceeds on the average 4 km at lower snowstorms in 73% of events. 2) Intense general snowstorms deteriorate always the visibility to 1 km and less; in the October-March-period, the visibility was less than 0.5 km in 94-100% of intense snowstorms events. 3) At moderate snowstorms, the visibility is deteriorated to 1 km and less in 74% of events. With increasing wind speed, the probability of poor visibility at moderate snowstorms is increased; at wind speeds of more than 20 m/sec, the visibility was noted as less

The Conditions of the Horizontal Visibility Deterioration at Snowfalls and Snowstorms in the Airport of Nikolayevsk-on-Amur

than 0.5 km in 85-100% of events. 4) All intense snowfalls are accompanied by a visibility of less than 4 km, whereat it is deteriorated to 1 km and less in 93% of events. At moderate snowfalls, the visibility was less than 2 km in 80% of events. At soft snowfalls, the visibility exceeds usually 4 km. 5) The majority of events of poor visibility at snowfalls and snowstorms is caused by the presence of wide and low cyclones over the Sea of Okhotsk. The probability of intense deterioration of visibility is the greater, the nearer the cyclone is located to the Nikolayevsk district and the lower the pressure in its center.

4177. LEPTOSPIROSIS OF THE BATAVIA TYPE IN BSSR (Russian text) -
Deshurova A.V. and Fillipovich A. N. - ZDRAVOOKHR. BELOR.
1958, 4/5 (32-33) Graphu 2

A case of an acute febrile disease is reported, which presented chills, high fever, headache, muscular pains, hepatomegaly, and an abundant skin rash over the extremities and trunk. Leptospirae were cultivated from the circulating blood and identified as *L. bataviae*. The isolated strain gave positive agglutination-lysis with the serum of another patient in the same locality. This was the first discovery of *L. bataviae* in man in the White Russian SSR.

Ms. Frigyes. A meteorológiai kutatás időszaki kérdései. [Current problems in meteorological research.] 1953rás, Budapest. 59(2):65-70, March/April 1953. Russian and French summaries. p. 65 DWB-A modern building for the Hungarian Meteorological Institute; a teletype circuit with Prague and thus indirectly with Potsdam; establishment of research stations for agricultural meteorology and for the microclimatology of Lake Balaton; participation in international conferences; extensive educational activities, etc. are mentioned as achievements in Hungarian meteorology during recent years. Service to agriculture is emphasized as the foremost objective of meteorological research. Research programs in the Hungarian Meteorological Institute in the fields of dynamic meteorology and synoptic meteorology. Investigation of excessive precipitation, drought, fire damage and disastrous storms as related to atmospheric circulation; long-range forecasting (polar charts are now being prepared regularly); aviation meteorology, ionospheric and electrical measurement, radiation measurement, climatology (a climatic atlas of Hungary to be published in 1955) and microclimatology, are outlined. Subject Headings: 1. Meteorological research 2. Hungary --G.T.

Dosi Frigyes, A virtuális hőmérséklet [On virtual temperature.] Időjárás, Budapest, 1936, 17, March/April 1936, 7 esp. DLC—The two most commonly used formulas for virtual temperatures (T_v) are: $T_v = \frac{T}{1 - 0.377 \bar{v}/p}$ and $T_v = T(1 + 0.604 \bar{v})$, where T = temperature (degrees absolute), \bar{v} = specific humidity, p = pressure and \bar{v} = vapor pressure. This note suggests a simple mathematical procedure for deriving one of these formulas from the other, which has not been done before in world literature. Subject Heading: 1. Virtual temperature determination.—G.T.

BESI, F.

Undesirable consequences of a lack of meteorologic knowledge in our agricultural production. p. 129. IDOJARAS. (Meteorologial Intezet es Magyar Meteorologial Tarsasag) Budapest. Vol. 60, no. 3, May/June 1956.
