TITLE: Reduction of the Stroke in the Rolling-on of Thread.
(Sokrashtheniye Dliny Khoda Pri Nakatyvanii Rez'by).

PERIODICAL: "Stanki i Instrument" (Machine Tools and Cutting Tools, No.3,
1957, pp.29-31 (U.S.S.R.).

ABSTRACT: In thread rolling machines with flat rolling formers, the component carries out a number of revolutions. It is claimed that the number of complete turns can be greatly reduced in the range of 3 mm to 10 mm threads. Several details of former geometry are discussed, a graph is given for the total profile depth from which the number of turns recommended for full profile formation is derived.

There are 7 illustrations, including 4 graphs.

There are 3 Soviet references.

AUTHOR: DEYNEKO, V.G.

TITLE: The Rolling-In of Threads by Means of Rollers of Different Diameters. (Nakatyvaniye rezhy dvumya rolikami raznykh diametrov, Russian)

PERIODICAL: Stanki i Instrument, 1957, Vol 28, Nr 7, pp 26-28 (U.S.S.R.)

ABSTRACT: The cutting of threads by rolling can be carried out with rollers of either the same or different diameter, on which occasion the difference in rotational speed is attained in 2 ways: By the same numbers of revolutions two rollers of different diameter (illustration 1) and by different numbers of revolutions of two rollers having the same diameter (illustration 2). The semi-finished material having the suitable dimensions is conveyed to the working space between the rollers either by hand or automatically; this is done at a certain speed which depends on calculation and on the character of the work. The larger roller with higher rotational speed transports the semi-finished material between the rollers, on which occasion this material rotates round its own axis and is, at the same time, pushed forward between the two rollers over the sector α_1 (illustration 3).

Card 1/2

121-7-10/26

The Rolling-In of Threads by Means of Rollers of Different Diameters.

Cutting the threads is brought about as a result of the action of frictional forces. Mechanical means of pushing the semi-finished products between the rollers during the thread-cutting process are not necessary, there ~~must~~ only be a certain ratio between the average diameters of the driving and the driven rollers. Illustration 4 shows how the semi-finished material is seized by the rollers, and computation of the numbers of revolutions of the semi-finished material during the process is explained. Special cases of roller-thread cutting are shown by illustrations 6 and 7.

In conclusion we are told that in a number of factories the rolling-in of triangular and other profiles as well as the calibration of smooth rods has been introduced.

TITLE: Clean Working of the Surfaces of Blanks for Pressing- and Cleaning-Operations by the Chip-Less Method (Chistota obrabotki poverkhnostey zagotovok dlya nakatyvaniya i otdelochnykh operatsiy bez snyatiya struzhki)

PERIODICAL: Priborostroyeniye, 1958, Nr 6, pp. 23-24 (USSR)

ABSTRACT: In chip-less cleaning the part treated is clamped between two revolving rolls. The pressure brought to bear by these rolls upon the surface of the metal part causes the latter to be plastically deformed. The microprofile existing after normal working operations is smoothed out to a considerable extent with respect to its elevations and depressions. The following method was found to be very successful also as regards volume: The part is treated by two highly polished rolls of equal diameter in which case work must be carried out with a certain feed. However, also working with the part between two rolls of different diameters gave good results. By this method it is easily possible to increase the purity of the surface of the worked part by from 3 to 8 classes. It is

Card 1/2

TITLE:

Increase of Accuracy of the Rolling of Fine Threads With Plane Screw Dies by Alteration of Their Parameters

PERIODICAL: Priborostroyeniye, 1959, Nr 12, pp 17-18 (USSR)

ABSTRACT:

By way of introduction the author discusses the faults resulting from inaccurate adjustment and states that a pitch error causes a 1.732-fold error of the diameter. Thread rollers are easily adjusted, whereas the adjustment of plane screw dies is complicated. A formula is given for the calculation of the length of the immobile screw die, and it is noted that the length of the mobile and immobile screw dies may not be arbitrary. A relation between the two lengths is derived, and it is shown that perfect thread surfaces can be obtained only by exact adjustment. In the case of correctly adjusted dies, accuracy is also very high. It is most convenient to make screw dies by milling since otherwise special requirements must be met concerning the relative position of the thread profile in the two dies. Next, the author discusses the nonagreement between the pitch angle of the dies and the pitch angle of the finished thread, which results from axial shift of the

Card 1/2

SOV/119-59-12-8/18
Increase of Accuracy of the Rolling of Fine Threads With Plane Screw Dies
by Alteration of Their Parameters

bolt during the rolling process. A formula is given, and it is noted that the pitch angle of the screw dies should be equal to the theoretical value or a little greater in order to prevent rupture of thread parts of the bolt. Standards are worked out for the entrance of the plane screw dies and their gripping angle. Thus, shaping of the thread is achieved over the entire length of the entrance and satisfactory work of the dies is guaranteed. Finally, the author demands to reduce cost and improve the quality of rolled threads. There are 1 figure and 1 Soviet reference.

TITLE: Method of separating pure hexamethylenediamine
SOURCE: Khimicheskaya promyshlennost', no. 3, 1965, 178-180
TOPIC TAGS: hexamethylenediamine, adiponitrile, hexamethyleneimine, rectification, polymer, nylon technology
ABSTRACT: A method of rectification purification of hexamethylenediamine (HMD), obtained by hydration of adiponitrile (ADN), to remove hexamethyleneimine (HMI) and other impurities was developed. First, the vapor-liquid equilibrium conditions of the HMI-HMD, HMD-ADN, and HMI-ADN systems were determined by measuring temperature, pressure, and vapor tension with an ebullioscope (type used by U.S. Bureau of Standards) and by calculating the equilibrium conditions from a set of 7 equations. The pressure-temperature-phase separation relationships for the three systems are presented in graphical form, and other parameters (including activity coefficients) are given in table form. The pure HMD separation experiments were performed in a 1500-mm high, 30-mm diameter rectification column. The reaction mixture was introduced with $\approx 15\%$ by weight of water.

Card 1/3

L 48133-65							
ACCESSION NR:	AP50086,2						
<p>The first fractionation at atmospheric pressure and 95.5°C removed a mixture of HMI and water (50% HMI); the second at 20-25 mm Hg contained 1,2-diaminocyclohexane and traces of H₂O and HMD; the third fractionation at 20 mm Hg and 94°C yielded pure HMD as determined by its crystallization temperature of 40.9°C. The ADN had to be cleaned by the permanganate method before using to obtain pure HMD. An industrial rectification method for obtaining pure HMD is recommended as shown in Fig. 1 on the Enclosure. Technical HMD with 15% H₂O is introduced in Column I where HMI and H₂O are removed. H₂O, low boiling point impurities and 1,2-diaminocyclohexane are removed in Column II. After a secondary purification pass in Column III the pure HMD is obtained from Column IV. Orig. art. has: 4 figures and 4 tables.</p>

TITLE: Comparison of arbitrary additive noises by the effectiveness of their detection or correction.

B

SOURCE: Problemy peredachi informatsii, v. 1, no. 3, 1965, 29-38

TOPIC TAGS: noise detection, random noise signal, error correcting code

ABSTRACT: This article is a generalization of an earlier work (Ob ispravlenii proizvol'nogo shuma i naikhudshem shume. Teoriya peredachi informatsii, sb., M., Izd. "Nauka", 1964, 26-31) in which the author investigated only the problem of the effective correction of noises for a binary case. The present work investigates the problem of a comparison, in a finite Abelian group, of all the additive noises of a prescribed capacity by the capacity of the maximum detection or correction codes. The capacities of the maximum codes, detecting or correcting the best or the worst noises of the prescribed capacity, are found with an accuracy with one order of magnitude; some of the characteristics of these noises are indicated. In the binary case, the problem of the comparison of Card 1/2

Abstract : The mutual solubility (MS) in binary systems consisting of methanol I and n-hexane II, n-heptane III n-octane and n-nonane, as well as in ternary systems containing water besides the above mentioned components was studied at 2 to 45°. The MS of methanol, water and normal hydrocarbons at temperatures between 20 and 10° decreases with the increase of the molecular weight of the hydrocarbon and changes very little with the temperature drop within the range of from 20 to 10°.

Azeotropic hydrocarbons and water. V. I. Kostyuk, V. M. Friedman and I. V. Dvinskaya. Zhur. Fiz.-Khim. 40, 1139-1143 (1967). The properties of azeotropic mixts. were studied by rectification and by the method that requires explicit tables of vapor pressures of 2 mixts. (i.e., *cit.*). BuOH forms azeotropic mixts. with C_4H_10 , C_5H_{12} , C_6H_{14} , C_7H_{16} , and C_8H_{18} , the b.p. and the BuOH contents of which are (in the order given): 68.3, 6.2, 93.85, 18, 108.44, 45.2, and 116.9, 71.5%. The d. of the azeotropic mixts. of BuOH- C_6H_{14} and BuOH- C_7H_{16} exhibit a neg. deviation from additivity and a pos. deviation from ideality. The b.p. and % MeOH of M carbons are: 83.4%. The b.p. and the wt. % of BuOH and H_2O of the ternary azeotropes are: 61.5, 2.9, 19, 18.3, 69.9%, and those of the azeotropic mixts. with the same hydrocarbons, of the pure components of the azeotropes, are: 9127.8. The lower than the corresponding binary azeotropes is

Comparison of the compns. of the azeotropic mixts. with the same hydrocarbons and those of BuOH- H_2O with the ternary mixts. shows that the latter contain a higher relative proportion of C_6H_{14} , and H_2O . This regularity previously suggested (C.A. 81, 91278), i.e., of the ternary azeotropic mixts. are those of the pure components and of the corresponding mixts.; this suggests the presence of ternary mixts. in the ternary mixts.

AUTHOR: Deza, M. Ye.

TITLE: Correcting an arbitrary noise and the worst case noise

B+1

SOURCE: AN SSSR. Institut problem peredachi informatsii. Problemy peredachi informatsii, no. 16, 1964. Teoriya peredachi informatsii (Theory of information transmission), 26-31

TOPIC TAGS: information transmission, noise, correcting code

ABSTRACT: The paper examines the following problem: for a given set A , $\{O\} \subset A \subset E_n$ (of noise) among all sets B , $\{C\} \subset B \subset E_n$ (of codes) such that $(A+A) \cap (B+B) = \{O\}$ (of codes correcting noise A), to find at least one set $B(A)$ having a maximum number of elements (a maximal code correcting noise A). [The condition $(A+A) \cap (B+B) = \{O\}$ denotes that $a_1 + b_1 \neq a_2 + b_2$ for $a_1, a_2 \in A$ and $b_1, b_2 \in B$.] The problem is a generalization of the known problem of correcting t errors. It is related to the problem of correcting errors when processing signals. The "worst" case and the "best" case noise of m elements is also investigated and maximal codes for correcting noises of a special type are developed.

DEZELIC, G.

The refractive-index increment of dextran for the molecular-weight determination by light scattering. M. Žebec,
Gj. Deželić, J. Kratohvil, and K. F. Schulz (Univ. Zagreb,
Yugoslavia). *Croat. Chem. Acta* 30, 261-5 (1958) (in
English).—On comparing published data for the increment,
 dn/dc , of dextran in water, considerable differences were
noted at wave length 546 m μ . These differences may cause
serious errors in calcg. mol. wts. of dextran from light-
scattering measurements. The following values for dn/dc
were found (in cc./g.): 0.1518 \pm 0.0012 for 438 m μ ,
0.1461 \pm 0.0013 for 546 m μ , and 0.1470 \pm 0.0013 for 578
m μ . These values agree very closely with the mean values
published in the literature. I. Kratohvil

Combination of dinitrophenylhydrazine with $\text{M}_2\text{O}_2\text{N}_2\text{S}_2$ (Ball, Spec. Chemic., Yaroslavl, 1958, 6, 711-715).—Bis-nitrophenylhydrazone (I) in CHCl_3 -acetone and PbO_2 yield successively a green product (II), $\text{C}_{12}\text{H}_10\text{NO}_4$, m.p. > 200°, which decomposes at 250° to a brown polyoxotetraoxymaleimide (IV). Combination with CrO_3 yielded only (IV), whilst MnO_2 afforded a mixture of products containing I, yielding the adducts $\text{C}_{12}\text{H}_10\text{NO}_4\text{Mn}_2$, m.p. 140°, on hydrolysis with eq. Na_2CO_3 , and converted into (IV) on further oxidation. (I) and HCl and HIO_3 in AcOH give bis-nitrophenylhydrazine-dihydrochloride (V), decomps. > 200°, oxidized to (III) by PbO_2 . (II), (III) and (V) re-ignite (I), when reduced with $\text{Na}-\text{Hg}$. (I) and concentrated HNO_3 afford a mixture of nitrophenylhydrazine (VII), which melts at 350°, and nitrophenylhydrazine, m.p. 150° (decomp.), whilst fuming HNO_3 gives bis-nitrophenylhydrazine. The NO_2 of (VII) is replaced by SO_3H by the action of oleum.

Polarographic investigations on the chemistry of organo-

M. Debeljic, *Rad. Hrvat. Akad.* 271, 21-46 (1941). The reduction potentials of pyrrole and some of its derivs. were exmd., using 1 cc. of an EtOH soln. of the substance to which 10 cc. of 0.1 N aq. NH_4Cl was added. The concn. of the substance was 0.001 M. The measurements were made at room temp., dissolved O being removed by N₂. Pyrrole, Me 2,4-dimethyl-5-pyrrolecarboxylate, and di-Et 1-amino-2,5-dimethyl-3,4-pyrroledicarboxylate show no reduction at the dropping Hg electrode. The (neg.) reduction potentials (in v.) of the other substances were: 2,3,4,5-tetramethylpyrrole 0.95 and 1.40, 2-pyrrolecarboxaldehyde 1.47, 4-methyl-3-ethyl - 2-pyrrolecarboxaldehyde 1.48, 4 - methyl - 3-ethyl - 5-pyrrolecarboxaldehyde 1.60, Et 3 - formyl-2,4 - dimethyl - 6-pyrrolecarboxylate 1.52, Et 5-formyl-2,4 - dimethyl - 3-pyrrolecarboxylate 1.44, 2 - formyl - 4-methyl-3-ethyl-5-pyrrolecarboxylic acid 0.99 and 1.50, 3-carboxy-2 - formyl - 4 - methyl - 5-pyrrolecarboxylic acid 0.88 and 1.36, 5-formyl-2,4-dimethyl-3-pyrrolepropionic acid 1.30 and 1.71, 5-bromo-4-methyl-3-ethyl-2-pyrrolecarboxaldehyde 1.16 and 1.49, 2-bromo-4-methyl-3-ethyl-6-pyrrolecarboxaldehyde 1.20 and 1.32, 3-methyl-4-ethyl-2,6-pyrroledicarboxaldehyde 0.84 and 1.61, and methylethylmaleimide 0.97. From the results, inferences for the structure of the compds. as well as for the dissoci. consts. of the acids were drawn. B. A.

Polarographic investigations of glucosin. I. Galactin and its derivatives. M. Dubick and J. Herak. *Arch. Kremu*, 1942, 10, 167-207. - The reduction potentials of galactin and some of its derivatives were examined, using 1 c.c. of a H_2O or EtOH solution of the substance to which 10 c.c. of 0.1N- NH_3Cl were added. The concn. of the substance was 0.01M. The measurements were conducted at room temp. except in case of tetra-acetylhelein, which was examined also at 27°, 40°, and 47°. Galactin and penta-acetylalgin show no reduction at the dropping Hg electrode. The (negative) reduction potentials of the other substances were: helicin 2.05, tetra-acetylhelein 1.185, nitrosalicylic acid 0.31, and salicylaldehyde (in presence of NH_3) 0.75 and 1.25 v. S. S. General and Physical Chemistry

Compounds of nicotine with organic acids. Determination of their composition by physicochemical methods. Mladen Detelić and Borjan Stančić (Sarajevo Univ., Yugoslavia). Bull. soc. chim. repub. pop. Bosnie et Herzégovine 1, 7-19(1952); cf. C.A. 35, 5505. — Values for nD^20 — nD^25 of binary systems contg. nicotine and formic (I), acetic, propionic, butyric, isobutyric, isovaleric, monochloroacetic (II), dichloroacetic (III), and trichloroacetic acids, resp., were detd. In these systems nicotine forms 2 groups of liquid acid complexes or mol. compds.: (1) those consisting of 1 mol. nicotine + 2 mols. of I, II, or III; (2) those consisting of 1 mol. nicotine + 3 mol. of one of the remaining acids.

Nicotine hydrate. Determination of its composition by physicochemical methods. Mladen Dezelic, Bogdan Stanislav, and Irena Grujic-Vasic (Sarajevo Univ., Yugoslavia). *Bull. soc. chimistes répub. pop. Bosnie et Herzégovine* 2, 10-17 (1963); cf. preceding abstr.—In order to investigate the exact compn. of nicotine hydrate, n_D^{20} , n_D^{19} , surface tension, cond., and pH of liquid mixts. of nicotine (I) and H_2O were detd. These data are tabulated and graphically represented vs. mol. % of I. A curve is also given showing differences between exptl. and calcd. values of n vs. mol. % of I. This curve and the surface tension curve have a max. at 25 and 30 mol. % I, resp. The cond. isotherm has an inflection at 25 mol. % I, while the pH curve is not indicative at all, having the shape of a neutralization curve. It is concluded that I forms with H_2O a trihydrate of the compn. $C_{10}H_{14}N_2 \cdot 3H_2O$. N. Plavsic

DEZELIĆ, Mladen

(3)

Compounds of nicotine with phenols. Determination of their composition by physicochemical methods. Mladen Deželić and Borkan Stuncić (Sarajevo Univ., Yugoslavia).

Bull. Soc. chimistes répub. pop. Bosnie et Herzégovine 2, 29-38 (1953); cf. C.A. 48, 1788c.—Liquid mixts. of nicotine with phenol, *o*-chlorophenol, *p*-chlorophenol, *o*-nitrophenol and *o*-, *m*-, and *p*-cresol were studied by detg. values of *n* (which are tabulated) at various temps. and compns. From the deviation of exptl. values of *n* from the arithmetic mean of the calcd. values it was concluded that compds. of 1 mol. of nicotine and 3 mols. of phenol exist in these liquid mixts., except the mixt. of nicotine with *o*-nitrophenol, the compn. of which could not be detd. by this method. N. Plavšić

DEZELIC, M.

Polarographic investigation of the autoxidation of vitamin C and the problem of its stabilization. M. Dezelic, J. Grujic-Vasic, and B. Boburevic (Sarajevo Univ., Yugoslavia). *Bull. soc. chimistes repub. pop. Bosnie et Herzegovine* 2, 65-67 (1963).—Observations are recorded on the rate of autoxidation of a 0.04% aq. soln. of L-ascorbic acid, with and without small addns. of CuSO₄ (I), K₄Fe(CN)₆ (II), and KCNS (III) at room temp. (18-20°) and -5°. The polarographic method was applied for controlling the autoxidation by detg. the acid concn. at various time intervals. Traces of I increased the autoxidation considerably; however, small amounts of II and III displayed a good stabilizing action, which was still better when Cu ions were present. The effect was better at -5° than at room temp.
N. Playfie

DezeLIC, M.

Conductometric and potentiometric titration of nicotine.
I. Electrochemical titration of nicotine with acetic acid
and with substituted acetic acids. M. Deyrelle and B.
Stanisic (Med. Faculty, Sarajevo, Yugoslavia). *Arhiv
Kemi*, 25, 141-50 (1953) (German summary).—Nicotine (I)
was conductometrically and potentiometrically titrated with
M and 0.2M solns. of AcOH, CICH₂CO₂H (II), C₂CHCO₂H
(III), C₃CCO₂H (IV), CNCH₂CO₂H (V), H₂NCH₂CO₂H
(VI), and Et₂CHCO₂H (VII). In all cases, the titrations
indicated a stoichiometric ratio of 1:1. The titr. curves
of the systems I + AcOH, I + VII, I + VI have pronounced
max., thus the corresponding I salts have a higher cond.
than the starting compds. In the systems with III, IV,
and V there is a kink in the curve at the equivalence point,
followed by a rapid rise; this signifies an increase in H⁺.
Only the I-II curve shows no distinct equivalence point.
The curves are similar for all the systems, except for the
systems I-VI, where the equivalence point lies within a
narrower pH range and is therefore less pronounced. This
is attributed to the formation of an inner salt in VI, so
that the eq. soln. is nearly neutral. I salts of mono-
carboxylic acids are of the same type as NH₄ salts in aq. soln.
In the absence of H₂O, addn. compds. may be formed,
contg. 1, 2, or 3 mols. of acid; most frequently the ratio is
1:2. Werner Jacobson

Dezelje, Mladen

YUGO.

J. Polarographic determination of the autoxidation of vitam.
min. C and the problem of its stabilization: II. Mladen
Dezelje and J. Grujić-Vasić (Univ. Sarajevo, Yugoslavia).
Bill. soc. chimistes repub. populaire Bosnie et Herzégovine 3,
23-2 (1954) (German summary); cf. C.I. 48, 7063.—By
addn. of 0.0001M of ZnSO₄ and FeCl₃ to 0.002M solns. of
ascorbic acid (I), the concn. of the latter (detd. polarographi-
cally, after standing for 24 hrs. at room temp., dropped from
100% to 25-27% (to 45-50% in case of FeSO₄ and
Pb(NO₃)₂). The catalytic effect of cations on the auto-
oxidation of I decreases in sequence of Cu⁺⁺, Zn⁺⁺, Fe⁺⁺⁺,
Fe⁺⁺ and Pb⁺⁺. Upon addn. of K₃Fe(CN)₆ or KCNS,
however, after 48 hrs. at room temp., the concn. of I was
over 80% (95% with samples kept in refrigerator). It is
concluded that before detg. polarographically vitam. C
in small amts. (1-3 mg./100 ml.) should be added to its soln.
in order to obtain more accurate results. N. Plavšić

ABSTRACT :

III R = H, R' = NC₂H₅(OH)COOH;
 IV R = COCH₃, R' = NC₂H₅(OH)CO-
 OH; V R = H, R' = NNCOC₂H₅N(Y-
 autopod NNHC₂H₅N); VI R = COCH₃,
 R' = NNHCOC₂H₅N

Polarographic investigation of pyrroleazomethines. Croat chem acta
32 no.1:31-38 '60. (EEAI 9:12)

1. Kemijski Institut, Filozofski fakultet, Univerzitet, Sarajevo,
Bosna i Hercegovina.

(Polarograph and polarography)
(Pyrrolecarboxaldehyde)
(Methylenimine)

DEZELIC, M.; TRKOVNIK, M.

Polarographic study of cumarins. Croat chem acta 33 no.4:
209-217 '61.

1. Kemijski institut, Univerzitet, Sarajevo.

DEZELIC, Mladen, dr.; GRUJIC-VASIC, J.; REPAS. A.

Metallic salts of esculin and fraxin, and salts of their
aglycons. Glasnik hemicara BiH 11:25-30 '62.

1. Hemijski institut, Medicinski fakultet, Univerzitet,
Sarajevo.
2. Redacteur en chef, "Glasnik Drustva hemicara i tehnologa
SR Bosne i Hercegovine" (for Dezelic).

DEZELIC, Mladen, dr.; REPAS A.

Condensation products of helicin. Pt. 5. Glasnik hemicara BiH
11:5-11 '62.

Some combinations of tetraacetylsalicin with barbiturates.
13-17.

1. Laboratorij za organsku hemiju i biohemiju, Hemijski institut Prirodno-matematičkog fakulteta u Sarajevu.
2. Redacteur en chef, "Glasnik Društva hemicara i tehologa SR Bosne i Hercegovine" (for Dezelic).

BOBAREVIC, B.; DEZELIC, Mladen, dr.; JOVANOVIC-KAPETANOVIC, V.

Some pyrrol-2-aldehyde combinations with acid hydrazides.
Glasnik hemicara Bih 11:79-83'62.

1. Hemijaki institut Medicinskog fakulteta u Sarajevu.
2. Redacteur en chef, "Glasnik Drustva hemicara i tehnologa SR Bosne i Hercegovine" (for Dezelic).

DEZELIC, M.; BOBAREVIC, B.

Syntheses of barbituryl-pyrryl-methines. Some condensation products of pyrrole-2-aldehyde with barbituric acids and barbiturates. Croat chem acta 34 no.2:71-74 '62.

1. Laboratory of Organic Chemistry, Institute of Chemistry,
Faculty of Science, Sarajevo, Yugoslavia.
