Title : ~~Standardization of apparatus coils~~
Standardization of apparatus coils

Periodical : Energetik, 5, 9-10, My 1955

Abstract : With the development of automation, a large number of components of the automatic control systems became standard products. This standardization should be pushed further, claims the author, who found that relay coils in the USSR are not standardized, and that for the RE-180 type relay 15 different kinds of coils are produced, and for the PE-100 type, more than 40. This confusion finds its reflection also in publications. The author gives some examples.

TITLE: The Design and Manufacture of the Heating Elements of Thermal Relays (Konstruktsiya i izgotovleniye nagrevatel'nykh elementov teplovykh rele)

PERIODICAL: Energetik, 1958, Nr 10, pp 36 - 37 (USSR)

ABSTRACT: A reader (Mazur of the City of Bel'tsy) asked about the design of the a/m heating elements, what material they are made out of, what their parameters are and where the latter are published. The author answers all these questions, and says that the parameters of series RT elements are published in the magazine "Promyshlennaya energetika" (Industrial Power-Engineering), Nr 1 - 3 of 1958.

TITLE: The Simplified Calculation of Reactors with Steel Core (Uproshchenny raschët reaktorov so stal'nyy serdechnikom)

PERIODICAL: Energetik, 1959, Nr 1, pp 27 - 28 (USSR)

ABSTRACT: The author gives a simplified formula and 2 graphs which are said to be very helpful in solving all the fundamental tasks in reactor designing: a) the determination of the minimum size of the reactor's steel core; b) the determination of the necessary number of windings; c) the finding out of the required cross section of the winding wires; d) the determination of the different sizes of the coil airgap if the reactor is adjustable. The value of the current at different core-airgaps can also be easily established. There are 2 graphs.

of Rotation (Vibratsiya elektrodvigatelyay na
ponizhennoy skorosti vrashcheniya)

PERIODICAL: Energetik, 1959, Nr 5, p 39 (USSR)

ABSTRACT: This is the reply to a question asked by Zheltikova from Donskoy, Tul'skaya oblast', on what are the causes of vibrations in electric engines at reduced rotation speed. The author enumerates a series of possible causes and states that particularly vigorous vibrations can develop when the period of vibration in the foundation coincides with the vibration in the engine, which often occurs at a reduced speed of rotation.

TITLE: Simplified Calculation of the Winding Data of Asynchronous Single-Phase Low-Power Electric Engines. (Uproshchenny raschet obmotochnykh dannykh asinkhronnykh odnofaznykh elektrodvigateley maloy moshchnosti)

PERIODICAL: Energetik, 1959, Nr 5, pp 34-35 (USSR)

ABSTRACT: The single-phase engines are usually made by the same stamps used for the production of three-phase engines. Both types of engines are made of the same steel. This circumstance makes it possible to convert small, three-phase engines into single-phase. In such a case, the winding of the single phase engine will consist not of three, but of two parts: the work part occupying $2/3$ of the grooves and the auxiliary part occupying $1/3$ of the grooves. The calculation of both parts of the winding can

Card 1/3

SOV/91-59-5-20/27

Simplified Calculation of the Winding Data of Asynchronous
Single-Phase Low-Power Electric Engines.

be made by the method described by K.F. Dombrovskiy (Energetik, 1957, Nr 11 and 12). In this article the author explains how to determine the number of serially connected loops of the work winding, with the use of a graph shown on page 34, by formula

$$Q_b = \frac{3.14 \cdot D_i \cdot l}{2p} \text{ cm}^2,$$

wherein Q_b is the area of polar division, D_i is the inner diameter of the stator in cm, l is full length of stator iron in cm, $2p$ is the number of poles of the engine. Having found the number of loops in the work winding, it is possible to find out the number of effective conductors in one groove of the winding, by the formula

$$N_{eff} = \frac{3w}{z}, \text{ wherein}$$

Card 2/3

SOV/91-59-5-20/27

Simplified Calculation of the Winding Data of Asynchronous
Single-Phase Low-Power Electric Engines.

z is the number of stator grooves and w is the number of loops obtained from the graph. Once the number of conductors for one groove of the work winding is known, the profile of the winding is found experimentally, so as to have the conductors and the insulation fill up the groove completely. The author gives an example of calculations. There are 1 graph and 1 Soviet reference.

SOV/100-58-3-2/8

AUTHOR: ~~Dombrovskiy, N.G.~~, Professor and Satovskiy, B.I., Engineer.

TITLE: Progress of the Manufacture of Heavy Excavators in the USSR
(Razvitiye tyazhelogo ekskavatorostroyeniya v SSSR)

PERIODICAL: Mekhanizatsiya Stroitel'stva, 1958, No. 3, USSR Pp 5-9

ABSTRACT: The manufacture of heavy excavators began in 1949/50 when the first types E-505, E-1001, E-2001 and SE-3 were produced. Later self-propelled dragline excavators ESh-1 with a bucket capacity of 3.4-4m³ were produced and still later ESh4/40, a dragline with a bucket capacity of 14m³ and ESh14/75. Finally mechanical shovel EGL-15 was put into production. The five year period 1952/57 is criticised in respect of further expansion in the manufacture of even more powerful excavators e.g. Esh35/65 with a bucket capacity of 25m³ and EVG35/65 with a 35m³ bucket capacity. Further mechanical shovels EKG-2, (E-2005) and EKG-8 with bucket capacities of 6-8m³ were put into production. The mechanical shovel EVG-4 was constructed on the basis of Type EKG-8. The excavator EVG-6 has a bucket capacity of 6-8m³. Dragline ESh-6/60 was also put into production at this period. The standard heavy excavator is SE-3 on which production began in 1947 and there are now 220 machines of this type in operation. The bucket capacities are between 4 and 5 m³.

Card 1/3

SOV/100-58-3-2/8

Progress of the Manufacture of Heavy Excavators in the USSR

The type with the increased bucket capacity of 5m^3 was introduced through the initiative of Engineer P.I. Bykov and proved very satisfactory. An excavator with this increased bucket capacity handled $10,656,000\text{m}^3$ of excavated material during $8\frac{1}{2}$ working years. This excavator was modified in 1955/56 and is now known as Type EKG-4. In 1953/4 excavator EKG-8 with a deep reach for open cast mining was constructed its bucket capacity being 8m^3 (see Figure 1) Its output and technical data are given in Table 1. Figure 2 illustrates diagrammatically track-mounted mechanical excavators Types EVG-4, EVG-6, EVG-15 and EVG-35/65. In 1949/50 self-propelled excavators ESh-1 and ESh-4/40 came into production. Later excavators ESh-25/100 ESh-25/130 and ESh-50/160 (which is the heaviest type) were produced (see Figure 3.) The arm of this latter machine is up to 90m long and the bucket capacity reaches 20m^3 . Factories specialising in their manufacture are: "Elektrosila", factory KhEMZ, trust Elektroprivod, factory Gidroprivod and the Magnetogorsk cable factory. Table 2 gives the annual output values of the excavator ESh-14/75. Figure 4 illustrates excavator EKG-8 and Figure 5 the under-carriage of excavator EVG-6.

Card 2/3

SOV/100-58-3-2/8

Progress of the Manufacture of Heavy Excavators in the USSR

The most important factories engaged on the manufacture of excavators are: UZTM, NKMZ, KhEMZ and "Dinamo". Figure 6 illustrates excavators ESh-6/60. There are six figures and two tables.

TITLE: Quality improvement in construction and road-building equipment

PERIODICAL: Mekhanizatsiya stroitel'stva, no. 7, 1962, 11-14

TEXT: The article deals with the problem of repairs and overhaul in general construction and road building equipment, and stresses their high cost and the loss of time and disruption of schedules entailed by the introduction of more complicated machinery and their operation in series. Present methods of evaluation do not take sufficient account of operating costs, in particular of the losses incurred by idling while under repair. Manufacturers are mainly interested in reducing costs production — an unjustified approach from the national economy standpoint, since an inconsiderable economy in cost is invariably offset by a disproportionate reduction in service life and efficiency. A new approach to the problem of component parts is outlined, the salient points being: improved design from the wear viewpoint, with the appropriate life-time of each part or group of parts specified in advance. Mass production is in order only after a much longer, more thorough and scientifically planned running-in period of the prototype at the factory; supply of spare parts accompanying the equipments. Interspersed in the text are pertinent data on costs, service life, work-repair time ratios for Soviet-manufactured excavators, tractors, diesels, vibrators, etc.
