TITLE: Evaluation of radiation hazard and basis for establishing permissible doses of ionizing radiation for cosmonauts flying to the moon [Paper presented at the Conference on Problems of Space Medicine held in Moscow from 24 to 27 May 1966]

SOURCE: Konferentsiya po problemam kosmicheskoy meditsiny, 1966. Problemy kosmicheskoy meditsiny. (Problems of space medicine); materialy konferentsii, Moscow, 1966, 136

TOPIC TAGS: cosmic radiation biologic effect, radiation protection, radiation dosimetry, lunar space flight, radiation permissible dose, radiation protection

ABSTRACT: In estimating the potential radiation hazard of a lunar flight, the following factors were considered: 1) the space radiation environment on the lunar trajectory, 2) the combined effect of ionizing radiation and other spaceflight factors on the cosmonaut, 3) the possibility of physical shielding, and 4) the effectiveness of various recommended prophylactic substances. Radiobiological tests showed that the RBE of protons, which constitute the chief radiation hazard, is close to one. Thus it was possible to use experimental and clinical observations of gamma- and x-ray

Card 1/2

ACC NR: AT6036541

irradiation to evaluate the space radiation hazard on brief flights. Experimental studies on large laboratory animals were used to establish a basis for permissible doses during lunar flight. This method permitted evaluation of the character and degree of radiation injuries from gamma and proton irradiation in the dose range to be encountered during lunar flight. In addition, clinical observations of people subjected to local irradiation for cancer treatment were analyzed. A classification of regulated doses for brief spaceflights was made on the basis of this material. [W.A. No. 22; ATD Report 66-116]

Title : The Influence of Corn Feed on Blood Constants and the
Organism of Horses.

Orig Pub : Probl. zootechn. 1957, No 1, 27-39 (Romanian. Resume Rus.
and French).

Abstract : A control group of horses (2 horses) received during 60
days a ration which consisted of: five kilograms of hay,
4.75 kilograms of oats, 0.5 kilograms of fodder-briquets,
3 kilograms of straw, and 30 grams of salt. In the se-
cond group (2 horses) during a week the oats were replaced
by crushed corn kernels. In the third group (4 horses)
oats were replaced by corn kernels. The corn feed did not

Title : Study of unsaturated cyclic hydrocarbons and their halogen derivatives. Part 16.- Reaction of metallic sodium with 2,3-dibromocyclohexadiene-1,3

Periodical : Zhur. ob. khim. 24/10, 1842-1845, Oct 1954

Abstract : The complete characteristic and structure of 2,3-dibromocyclohexadiene-1,3 is presented. It was established that the reaction between metallic sodium and 2,3-dibromocyclohexadiene-1,3 results in the formation of polymeric products and not benzene as anticipated. New problems regarding the mechanism of isomerization, the ease and difficulty in displacing the H-atoms in various cases, stability of various types of deformed molecules, are discussed. TITLE: Calculation of aerodynamic forces and moments acting upon a cascade of plates vibrating in a planar stream of an incompressible fluid

B

SOURCE: AN BSSR. Izvestiya. Mekhanika, no. 3, 1965, 25-32

TOPIC TAGS: cascade, aerodynamic force, aerodynamic moment, aerodynamics, incompressible flow

ABSTRACT: The flow of an incompressible fluid around a cascade lattice consisting of an infinite number of thin, slightly curved profiles is studied. The blade profiles are vibrating with small amplitudes according to a certain harmonic law with constant phase displacement between fluctuations of adjacent profiles. The incoming stream is considered to originate at an infinite distance from the cascade and has a constant velocity V. A method of computing the aerodynamic forces and moments acting upon the cascade lattice is presented. An x-y coordinate system is used to fix a point on the blade profile during oscillation. Coordinates x_j and y_j of a point in the plane of the cascade are related to x and y by the equations

$$x_j = x + 2j\tau^{-1} \sin \beta, \quad y_j = y - 2j\tau^{-1} \cos \beta,$$

Card 1/2

L 62926-65

ACCESSION NR: AP5016229

where β is the outer point of the blade cascade, τ is the thickness of the lattice, h is the distance between two adjacent blades along the axis of the lattice, and o is a half-chord of a blade. Equations for stream potential and blade vibration characteristics are introduced and combined in a single equation in which the functions sought for solution are identified. The functions sought obey the Laplace equation and other stated conditions. Force and moment equations are developed which are functions of the law of motion of plates, geometric parameters, and Struchal's number. Several solutions of the final equation forms were generated on a digital computer. Results are displayed graphically and discussed in order to portray the computational accuracy, the effect of Struchal's number and phase shift, and the degree of interference of adjacent blades. The authors acknowledge the valuable comments of G. Yu. Stepanov. Orig. art. has: 10 figures and 33 equations.

Warsaw, Polski Tygodnik Lekarski, Vol 18, No 10, 4 Mar 63, pp 367-371.

Abstract: [Author's English summary] The natural and specific immunity was studied in the workers of the uranium mine. The results of these studies do not explain the clinical syndrome of diminished resistance to infection observed in these persons. However, lowered hemi -iso-agglutinin titre, increased number of lymphocytes, and a slight increase of the beta₂ globulins were observed. Of the 34 references, 22 are Polish, 5 are Russian, 4 German, and 3 English.

"Symptomatology of Newly Discovered Respiratory Tuberculosis in Soldiers."

Prague, Vojenské Zdravotnické Listy, Vol 31, No 6, Dec 62; pp 259-261.

Abstract: In 1960, 31.3% of the new cases of tuberculosis were found by mass screening, rest self-referred because of symptoms. Cases of the 139 servicemen and 22 professional soldiers with newly discovered tb seen at the UVM Aug 1959 - Dec 1961 are reviewed in detail to determine early symptom constellation. Nearly 50% had only 1 sign; over 50% were discovered by mass screening. Epidemiologic reasons dictate greater attention to problem in military environment. A discussion of the pathological picture and modern views on aetiology. The early diagnostic value of radiological examination is emphasized. The cases described favour the mechanical theory of chronic vesicular pneumocolon. In one the condition possibly arose in consequence of gastric ulcer perforation (presence of an ulcer scar). In the authors' opinion many additional factors such as chronic diseases of the respiratory tract, circulatory failure, chronic undernourishment may influence the appearance of this disease.

An autopsy case of a 3-month-old infant presenting multiple tumours in the myocardium is reported. Microscopical examination revealed glycogenic tumours (rhabdomyoma). Morphological comparison with embryonal myocardium led to the conclusion that these congenital glycogenic tumours of the heart are not a neoplasm but a product of focal glycogenic degeneration of differentiated muscle fibres of the myocardium.

Report on 14 autopsy cases of mycosis of the internal organs in children aged from 8 days to 13 months. The lesions occur in the upper parts of the alimentary tract and in the lungs. The death of one child at the age of 11 months was due to mycotic septicaemia with peritonitis and embolism in the skin. Thirteen children suffering from septico-toxaemia had received different antibiotics during a period from 6 to 30 days. Broad-spectrum antibiotic treatment may lead to an increased virulence of the fungi (Candida). Photomicrographs show the changes in different organs.

1731. THE MORPHOLOGICAL CHANGES OF THE CENTRAL NERVOUS SYSTEM AFTER COMBUSTION - Przyczynę do zmian morfologicznych ośrodkowego układu nerwowego w oparzeniach - Dominiczak K. Zakł. Anat. Patol. Pomorsk. Akad. Med., Szczecin - ROCZNIK P.A.M. 1957, 3 (195-227) Graphs 1 Tables 4 Illus. 38

In 28 fatal cases of burning the cortex of the gyrus centralis posterior, the basal ganglia (thalamus opticus), the pons Varoli and the medulla oblongata were examined histologically, using various staining techniques. Besides non-specific changes in the vascular system (congestion, erythrodiapedesis, small haemorrhages, haemolysis, proliferation of endothelium and adventitial cells) in 2/3 of cases coagulative thrombi and in 1/3 fibrinous balls were present in the vessels. Lesions and destruction of almost all nerve cells were recorded. Oedema of considerable extent was present, sometimes with small foci of colliquative necrosis. Counting of the damaged nerve cells showed that the degree and the extent of the burns as well as the survival period had no influence upon the cerebral tissue changes. It is concluded that there are no characteristic morphological changes of the CNS after burning. (V, 8*)

105. DOMINICZAK K. *Zakl. Anat. Patol. Pomorskiej A. M., Szczecin. Przypadek sarkoidozy serca A case of cardiac sarcoidosis* *Patol. pol.* 1957, 8/2 (143—148) Illus. 7

The author presents a case of cardiac sarcoidosis in a young woman. The clinical course of the disease indicated intraparenchymal inflammation of the heart muscle. A single enlarged lymphatic node in the pulmonary hilum, enlargement of the cardiac ventricles, thromboses in the walls of the cardiac ventricles, and many small foci in the cardiac muscle were ascertained at post-mortem. Histological investigations showed extensive granulation fields with a large number of giant and epithelioid cells, so that the arrangement of the cells in some places suggested tubercles. In the lymphatic node, numerous tubercles exhibiting no tendency to breaking down or to necrosis were ascertained. In the giant cells, Schaumann's bodies were found; these are characteristic of sarcoidosis. It appears from the literature that invasion of the heart in the course of sarcoidosis is very rare. Title : Problems Related to Environmental Use of Chemicals, Danger of Biocoenotic Changes, and Indications for Experimental Studies.

Orig Pub : Ekol. polska, 1955, Bl, No 3-4, 87-93

Abstract : A brief review of the literature is given on the disruption of biocoenotic relations resulting from wide use of insecticides, chiefly their destructive effect on beneficial fauna. The following problems are posed: 1) the question of agricultural and forest biocoenoses resistance to dangerous pest increases; 2) the revision of contemporary methods in applying chemicals in agricultural and forest industries; 3) the tendency to limit the use of synthetic insecticides to a minimum necessary for plant protection; 4) the study of the effect of insecticides on: a) plant development and accumulation in fruits; b) on useful animals; c) the quality of meat in farm animals; d) on human

health; e) on microorganisms and soil inhabitants; f) on parasites and eaters of harmful insects; 5) analysis of poisonous accumulations in soils, fruits and seeds, in animal and human organisms; 6) the biochemical study of insecticide preservation of the biotope: a) the process and tempo of their decomposition in biocoenosis; b) physico-chemical changes produced by them in soil and plants; c) the effect on yield of treated plants; 7) the production of new selective insecticides. The author offers a program of necessary organizational measures (the creation of new scientific institutions, summoning conferences, retraining of specialists).

TITLE: Influence of resonance ear protectors in lowering the occurrence of acoustic lesions in the army

SOURCE: Vojensko zdravotnicke listy, no. 4, 1965, 146-149

TOPIC TAGS: audition, acoustic biologic effect, protective clothing, military medicine

ABSTRACT: The audiometric test was used in 183 recruits to determine the value of resonance ear protectors in lowering the incidence of acoustic traumas caused by rifle firing. In the first 7 months of military duty, one-third of the recruits showed a definite deterioration of hearing in the high-frequency range, with a maximum at 20 dB and 4000 cycles. The group using the ear protectors had an incidence of damage of 19.2% compared with 37.2% for those not protected. The damage that occurred in spite of the protectors is due to the fact that the protectors are still produced in only one size, instead of the 5 or 6 sizes recommended. Orig. art. has: 4 figures and 4 tables. [JRS]

EXCERPTA MEDICA Sec.11 Vol.8/12 O.R.L. Dec 1955

2230. DOMINIUK K. Zakł. Ortodont. A. M., Kraków. Zabieg: plastyczny na wyrostku zębodołowym dla celów ortodontycznych. Plastic operations on the alveolar process for orthodontic purposes CZAS. STOMAT. 1955, 8, 5 (193-198) illus. 12

The following conclusions are arrived at: (1) Plastic operations following extractions performed for orthodontic purposes facilitate and accelerate autoregulation of individual teeth or their groups. (2) The freeing of non-erupted teeth from the surrounding bone and the surviving sac or germinal cyst facilitates the eruption of these teeth very often without the need of applying special extraction apparatus still in use for this purpose. (3) The use of dental plate prostheses and massage cause a renewal of the process of eruption of teeth that were hindered in eruption.

DOMINIŁ (T.) & JAGODZIŃSKI (S.). *Badania nad mykorrhizami niektórych drzew owocowych w ogrodach Kórnickich.* [Researches on the mycorrhiza of some fruit trees in the Kórnik Gardens.]—*Pam. Zobl. Bad. Drzew Lasu Kórnicko* [Mem. Trees For. Res. Inst., Kórnik], i, pp. 48-75, 10 figs., 1946. [English summary. Received July, 1947.]

The roots of the following species, growing in the Kórnik Gardens and Arboretum, Poland, were sectioned, stained, and examined microscopically: apricot, damson, cherry, almond, plum, quince, apple, walnut, black currant, gooseberry, *Pyrus calleryana*, *P. phaeocarpa*, *P. salicifolia*, *Malus rivularis* [*M. fusca*], *M. purpurea*, *Prunus serotina*, *Sorbus latifolia*, and lime (*Tilia platyphyllos*). All had endotrophic mycorrhiza except *P. serotina* and lime which had ectotrophic mycorrhiza. Damson had ecto-, endo-, and pseudomycorrhiza. The only mycorrhizal organism identified was a species of *Actinomyces* in quince.

Roy AM

DOMINIUK (T.) & TRUSZKOWSKA (Mme W.). Pracowniki do znajomości mykorhizy u niektórych Paproci. [A contribution to the study of mycorrhiza in some Ferns.] - *Acta Soc. bot. Polon.*, xviii, 1, pp. 45-63, 7 figs., 1947. [French summary.]

In their investigations of root systems of various ferns (cf. *R.A.M.*, xviii, p. 469), the authors found that *Ophioglossum vulgatum*, *Botrychium lunaria*, *Osmunda regalis*, *Pteridium aquilinum*, *Scolopendrium vulgare typicum* (*Phyllitis scolopendrium*) and its f. *crispum*, and *Struthiopteris germanica* formed endotrophic mycorrhiza, *Aspidium* (*Dryopteris*) *filix-mas* endotrophic and ectotrophic, while *Blechnum spicant* showed no symbiosis, probably because the material was taken from a cultivated park where the soil was pH 7. These results are contrary to Stahl's findings (*Der Sinn der Mykorrhizenbildung* (Filicinae) - *Jahrb. wiss. Bot.*, xxxiv, p. 268, 1900) that most ferns do not form mycorrhiza but are in accordance with those of Butler (*R.A.M.*, xviii, p. 469) and Asai (*ibid.*, xiii, p. 717).
