Abstract : Collapse of the labyrinth in 6 dogs rapidly evoked a transient disturbance of the gait, fatigability and prolonged (2 - 3 months) deviation from the normal in achievement of complex motions (leaping across a barrier, stairs with a steep slant). With unilateral labyrinthectomy impairments were expressed more strongly than with bilateral excision. Stimulation of the shoulder muscles to an alternate current diminished in the first twenty-

Graphic representation of chemical analyses of water.
 K. V. Filatov, *Doklady Akad. Nauk S.S.S.R.* 59, 101-1 (1948). A square is divided into 2 rectangular triangles by a diagonal running from the upper left- to the lower right-hand corner. The left-hand triangle is the anion triangle. The 2 equal sides and the height are divided into 100 equal parts; the horizontal side gives the amt. of Cl^- , the vertical side HCO_3^- , the height gives the amt. of SO_4^{2-} by the perpendicular dropped to it from the point of intersection of the perpendiculars to the sides drawn from the corresponding representative points. Similarly, the contents of Na, Ca, and Mg are represented in the right-hand triangle, on the vertical and horizontal side and along the height, resp. A water of given compn. is thus represented by 2 points, and each type occupies a definite area of the square. An analogous diagram can be constructed by dividing a rhomb into 2 triangles. The degree of mineralization is represented on a circular diagram consisting essentially of a series of equidistant concentric circumferences, the plane of the diagram being divided into 3 equal sectors, each subdivided into a central sector for the pure types and 2 side sectors for the transition types. Each circumference is divided into 100 parts, corresponding to mg. equiv. % of anions or cations. The distance of the representative circumference from the center expresses the amt. of dry residue. TITLE: A maser with a microcooler operating at 40°K

SOURCE: Radiotekhnika i elektronika, v. 11, no. 9, 1966, 1586-1588

TOPIC TAGS: maser, waveguide

ABSTRACT:

A ruby maser with a miniature closed-cycle cooler for operation at a temperature of 40°K is described (see Fig. 1). The resonator head (1) is a silver-coated ruby in the form of a parallelepiped with sapphire signal and pumping waveguides coupled to ordinary stainless-steel waveguides. The resonator is mounted between the poles of a

UDC: 621.375.8

Card 1/4

Fig. 1. Maser with microcooler

- 1 - Resonator head; 2 - magnet; 3 - support; 4 - microcooler cold zone tube; 5 - contact reed; 6 - air-tight flange of signal waveguide; 7 - air-tight flange of pumping waveguide.

miniature permanent magnet (2) rigidly attached to a support (3) which

Card 2/4

ACC NR: AP6031022

is maintained at normal temperature ($\sim 300^\circ\text{K}$). A copper reed (5) provides thermal contact between the cold zone (4) of the microcooler and the resonator head.

Total heat flux through the maser head is about 2 w at 10^{-3} mm Hg. By separating the resonator head from the waveguides, this heat flux is reduced to below 0.5 w.

The ruby maser was operated at the 3-cm wavelength in the push-pull mode. At a temperature of 40°K and with a chromium concentration in the ruby of 0.1% the quantity $(\sqrt{G}-1)\Delta f$ (G is the gain and Δf is the bandwidth), which determines the bandwidth characteristic of the amplifier, reached 19 Mc.

The observed dependence of gain on temperature (see Fig. 2) indicated that, with proper chromium concentration, variations in gain caused by changes in the microcooler temperature can be considerably reduced.

The measured noise temperature of the maser did not exceed 70°K , which was in agreement with the theory. Its amplitude characteristic was linear up to an input power level of $\sim 0.15 \mu\text{w}$ in the

Card 3/4

ACC NR: AP6031022

presence of a cw signal and up to an input energy level of 1.5×10^{-9} joule in the presence of a pulse signal of low repetition rate. No irreversible processes were observed, even in the presence of very strong pulse signals.

Fig. 2. Temperature dependence of maser gain

The maser was found to have a narrower transmission band and a higher noise temperature at 40° K than at liquid helium temperature. However, these disadvantages are offset by the economy and smaller size and weight of the maser. In addition, because of the relatively low noise level, high reliability, and physicochemical stability of the ruby crystal, the maser oper-

ating at 40° K can often match the performance of other types of low-noise amplifiers. Orig. art. has: 3 figures. [FSB: v. 2, no. 8]

TITLE: Regional works of correlation method of wave refraction (CMWR) in the
trans-Volga region of Saratov

SOURCE: Ref. zh. Geofizika, Abs. 10D111

REF SOURCE: Tr. Nizhne-Volzhsk. n. -i. in-t geol. i geofiz. vyp. 3, 1965,
156-165

TOPIC TAGS: seismic prospecting, seismograph, seismology, hodograph, wave
refraction data correlation, seismic station/SPEN-1 seismograph, PSL-1 CMWR
seismic station, Ural-2 electric power machine

ABSTRACT: A description is given of the method of field observations and inter-
pretations and results of surveys made since 1958 in the border area of the Caspian
depression. A study was made of the topography of the basement in order to find
large outcroppings and structures of the subsalt stratum and upheavals of the
platform type. The seismological characteristics of the region are presented. The

Card 1/3

UDC: 550.834.3

ACC NR: AR7001772

methodology of refraction correlation observations consisted in a continuous longitudinal profiling with a system of counter and overtaking hodographs, which ensured a complete correlation of reference waves, and also in a nonlongitudinal profiling, used only for mapping of the basement relief. In longitudinal profiling, each 5.7 and 11.4 km long station was surveyed from 13—15—21 explosion points. The hodographs were 30 km long and in the area of tracking of the refracted wave, they were 70 km long. On nonlongitudinal profiles, the station was 11.4 km long, and the distance from the explosion point to the profile (on the perpendicular) was 50—60 km. Waves were recorded by SPEN-1 seismographs (100 m from each other) and a 60 channel PSL-1 refraction correlation station with a filtration opening toward Hr, and with a steep right cut of the 27-cps frequency curve. On the territory of the trans-Volga area of Saratov, four main waves were found:— T₁ from the surface of the salt; T₂ from the subsalt bed to the depression; T₃ from the surface of the basement (?); T₄ from the interface in the thickness of the basement (?) [SIC]. Structural diagrams over two horizons were composed: The surface of the carbonaceous sediments of Lower Permian age, which has a monoclynal dip to the South and the South East toward the Caspian depression; the surface of the basement, characterized by a rather sharp dislocation with a general dip to the

Card 2/3

ACC NR: AR7001772

South. On the whole, the outer part of the border zone shows an irregular dip of the basement toward the Caspian depression, while the inner part is a salt dome tectonic formation. T. Polyakova. [Translation of abstract] [GC]

USSR/Transportation
Automotive Transport

Feb 1948

"An Important Reason for the Reduction in the Cost of
Automotive Freight Transport," N. Filatov, 2 pp

"Avto" No 2

Automotive transport plays a vital role in Soviet
national economy. Reduction by 1% in the over-all
cost of such transport would result in annual saving
of 100 million rubles. States that because this sav-
ing would create all-around reduction in prices,
everyone is urged to suggest means for reducing the
cost of automotive transport.
