THERAPIA MEDICAL Soc.9 Vol.11/6 Surgery June 57
FRANKL Z.

2940. FRANKL Z. Dept. of Oral Surg., Péterfy Sándor utca Polyclin., Budapest.
"Arrest of severe parenchymatous oral haemorrhages by thrombin infiltration" THERAPIA HUNG. 1956, 1 (II-14) Illus. 4
The procedure is described. The infiltration of thrombin may be employed as a preventive measure in haemophilia or similar conditions. In such cases any dental or oral surgical intervention is carried out under thrombin protection after general preparation of the patient and, to enhance the local haemostatic action, an absorbable fibrin sponge is also applied, along with an acrylate plate which provides pressure. Three case histories are presented. Tagay - Istanbul

AKADEMIA MEDICA Sec.9 Vol.11/10 Surgery Oct 57

5217. FRANKL Z. Mund- und Kieferchir. Abt., Krankenh. Poliklin. Péterfy Sándor-utca, Budapest. "Gelenksbildung mit einem Fibrinkappen-Interpositum im Kiefergelenk. Formation of a jaw-joint by the interposition of a fibrin crown into the articulation DTSCHE." ZAHN-, MUND- U. KIEFERHEILK. 1956, 25/5-6 (201-203) Illus. 6
This is done in cases of ankyloses of the jaw. The fibrin does not provoke any foreign body reaction. After fresh cartilage has been laid down on the joint surfaces by the undisturbed function, the fibrin is reabsorbed without trace - this is an advantage in comparison with vitallium or artificial material as interposita.

EXCERPTA MEDICA Sec 9 Vol 13/10 Surgery Oct. 50

5752. ACCURATE LOCALIZATION OF OSTEOTOMY IN KOSTECKA'S OPERATION FOR PROGNATHISM - Die genaue Lokalisation der Osteotomie bei der Kostecka'schen Progenie-Operation - Frankl Z. Mund- und Kieferchir. Abt., Krankenh.-Poliklin., Budapest - OST. Z. STOMAT. 1958, 55/2 (63-71) Illus. 26

Kostecka performs osteotomy of the ramus mandibulae as a treatment of prognathism. He has devised an appropriately curved needle with which the Gigli saw used to saw through the ramus can be easily introduced behind the ramus. This allows quick operation without skin incisions or trauma to the surrounding soft tissues. The risk of infection is minimal, the facial nerve is not injured. The prognathism is corrected by postoperative interdental splinting. Twenty-five years of practical experience have confirmed the efficacy of this method.

Abstract : of the anticholinesterase properties (78.9% blocking in dilution of 1:1000 as against 100% blocking in dilution of 1:10,000). In a series of monoethyl amides the replacement of radicals linked to phosphorus and of the undivided chains by isogroupings as well as an increase in the number of carbon atoms lowers toxicity but has no effect in their anticholinesterase properties. A decrease in toxicity and anticholinesterase properties takes place when the number of carbon atoms in radicals linked to nitrogen is increased and the compounds in which the radicals are linked to phosphorus contain undivided chains. In such cases, the presence of isogroupings causes an increase in toxicity and anticholinesterase properties.

Estimation of small amounts of trichloroethylene and trichloroacetic acid. Bohumil Soucek and Eva Frankova (Charles Univ., Prague, Czech.). *Prace na Lekarstv.* 21, 73 (1959).—As absorbent for C_2HCl_3 , a mixt. of 01.54% pyridine, 38% water, and 0.40% of 16% NaOH soln. is superior to previously used solvents because it does not contain excess alkali. C_2HCl_3 was liberated from water contg. biol. material by bubbling N through the soln. at 90° for 60 min. (av. recovery $101.0 \pm 0.5\%$), or by distg. *in vacuo* at +20° and 10 mm. Hg for 5 min. ($98 \pm 14.0\%$) and was absorbed in the pyridine soln. at -18°. C_2HCl_3 can be estd. in the presence of CCl_3CO_2H by distn. *in vacuo* and detg. it in aq. soln.; the av. recovery is $107.5 \pm 32.4\%$ when approx. 10 γ is present, and $77.5 \pm 13.8\%$ for approx 66 γ . CCl_3CO_2H is estd. in the residue with an av. recovery of $89 \pm 9.8\%$ if the abs. amts. are 5-500 γ . In blood C_2HCl_3 was detd. in the presence of CCl_3CO_2H with the same accuracy as in aq. solns. but CCl_3CO_2H could be detd. only to 80%. In the air C_2HCl_3 can be estd. with an error ± 10 to 20% in amts. up to 10 γ and $\pm 5\%$ if over 10 γ .

"Development of Spontaneous Motor Activity in Rats During Initial Phases of Ontogenesis."

Prague, Activitas Nervosa Superior, Vol 8, No 3, Sep 66, pp 248-257

Abstract [Author's English summary modified]: The study covered the first 4 weeks of life. The activity was measured in an empty undivided cage (basic situation); this was best suited for the first 2 weeks of life; later the variety of activities could be observed better in a more broken up space. Two other situational conditions met by the rats in a later stage of life provided a variety of stimuli; rats exposed to the additional stimuli showed a greater variety and intensity of activities, indicating that the stimuli exercise a positive influence on the development of activity. Higher activity shown by very young rats was maintained by these individuals in later life, 3 Figures, 2 Tables, 23 Western, 4 Czech references.

*Effect of local fluorization on the microscopic structure and the penetration of the hard tooth tissues STOMATOLOGIJA 1953, 6 (27-28) (Russian text)

In the first experiment the teeth were examined microscopically in ordinary and in polarized light before and after fluorization. In the 2nd the enamel was examined for penetration of methylene blue and in the 3rd and 4th experiments both the enamel and the dentine were examined for penetration of silver nitrate before and after the local application of fluorine. The results indicate that an obliteration of the organic parts of the enamel and the dentine tubuli may occur. Fluorization of the organic parts of the hard tooth tissues seems to play a certain role in caries prevention.

AUTHORS: Poray-Koshits, B. A., Frankovskiy, Ch. 79-28-4-18/60

TITLE: Investigations in the Field of the Diamines of Benzimidazole Series (Issledovaniye v oblasti diaminov benzimidazol'nogo ryada).

I. The Synthesis and Physical and Chemical Properties of Diamines (I. Sintez i fiziko-khimicheskiye svoystva dia-
minov)

PERIODICAL: Zhurnal Obshchey Khimii, 1958, Vol. 28, Nr 4,
nn. 928-934 (USSR)

ABSTRACT: In the present paper the authors synthesised the diamines of the benzimidole series and examined their physical properties. As could be assumed from theoretical considerations and from data found in publications, the diamines of this series should furnish substantive dyes in the case of an diazotiation and an azo combining. The diamines of the benzimidazol series have been described only little in publications. Therefore it was necessary to develop a method for their production. These diamines proved to be accessible according to their method of synthesis.

(see experimental part). The dependence of the reactivity of aromatic amines in acylation on their basicity constants, on diazotization, on the formation of azomethines on the diazoamino compounds and on the imidazole derivatives was investigated already earlier (Reference 1). In the present paper the authors investigated the dependence of the basicity constants of the synthesized diamines on their structure. The problems of the interrelations existing between the basicity constants (of the 1st and of the 2nd), of the coincidence of the diazotisation of both amino groups etc. are very complicated and of great theoretical and practical interest. In the cases described here the dependence of the basicity constant on structure was even more complicated, because the investigated products posses three basicity constants. As the first basicity constant in most investigated diamines is about the same and approximates the value of the basicity constant of benzodazole ($k \approx 1.10^{-9}$) it obviously must be

Card 2/4

Benzimidazole Series. I. The Synthesis and Physical
and Chemical Properties of Diamines

79-28-4-18/60

attributed to the imidazole nucleus. From this it follows, that the 1st and 2nd constant must be attributed to the amino groups of the investigated diamines. The basicity constants were determined by the method of potentiometric titration. The results of the investigations are given in the table.

Summary: The diamines of the benzimidazole series possessing 2 amino groups in different benzene nuclei, have nearly identical basicity constants independent from the fact, whether their amino groups are conjugated to each other, or not. The cause of this phenomenon must be looked for in the fact, that above all the most basic imidazole nucleus reacts in the salt formation. Its transformation into a onion ion interrupts conjugation between the amino groups.

There are 1 figure, 1 table and 8 references, 4 of which are Soviet.

TITLE: Investigations in the Field of the Diamines of Benzimidazole Series (Issledovaniye v oblasti diaminov benzimidazol'nogo ryada).

II. Substantive Properties of the Azo Dyes- of Diamine Derivatives (II. Substantivnyye svoystva azokrasiteley - proizvodnykh diaminov)

PERIODICAL: Zhurnal Obshchey Khimii, 1958, Vol. 28, Nr 4,
pp. 934-938 (USSR)

ABSTRACT: According to a number of authors (References 1-4) one of the essential factors of the substantivity of dyes is represented by its chemical structure, in particular the length of the conjugated compound chain and the linear arrangement of molecules. The present paper is a continuation of the investigations by A. Ye. Poray-Koshits in the field of the substantive benzimidazole dyes. According to the opinion of A. Ye. Poray-Koshits the benzimidazole

Card 1/3

Investigations in the Field of the Diamines of
Benzimidazole Series. II. Substantive Properties of the
Azo Dyes- of Diamine Derivatives

79-28-4-19/60

nucleus is a strong chromophore influencing the substantial properties of the dye molecule. Therefore it could be expected that the benzimidazole dyes posses a sufficiently high substantiability. In a previous paper (Reference 5) 7 diamines of this series were described and their structure as well as their basicity constants were accurately determined. The aim of the present paper was the synthesis of the azo dyes of the investigated diamine derivatives and the examination of their substantive properties. 1,5 - naphthol sulfo acid for single dyes as well as the naphthion and H.I -, and the Chicago-SS-acids were employed as azo components. With these examples the influence of the diamino structure on the substantive properties of the dyes and the influence of the azo components was observed. Table 1 and 2 give the results.

Summary: Dyes formed from bisazotized diamines of the benzimidazole series and from 1,5 naphtho sulfo acid, posses different substantialities, depending on whether the azo groups are mutually conjugated or

Card 2/3

Investigations in the Field of the Diamines of
Benzimidazole Series. II. Substantive Properties of the
Azo Dyes - of Diamine Derivatives

79-38-4-19/6o

not. According to the substantiality of the obtained dyes it is possible to pass a judgement on the presence of the absence of conjugation between the amino groups of the initial diamines. The character of the influence of other azo components (e. g. I-, H-, or Chicago - SS acids) on the substantiality of azo dyes is analogous to that of the benzidine dye series.

ABSTRACT: An in vitro method of serial dilutions was used to test the activity of several synthetic azo-compounds in relation to dermatophytes, some gram positive and gram negative bacteria and two species of yeastlike molds. All the tested azo-compounds containing a carboxylic group proved inactive. The exception was 2,4-dichlor-3-carboxy-4'-oxyazobenzol. The azo-compounds displayed highest activity in relation to Cr. neoformans, weaker activity in relation to dermatophytes, and the weakest in relation to Candida albicans. Only

UDC: 615.7

certain azo-compounds displayed antibacterial and antivirus action. The highest in vitro activity was displayed by 2,4-dichlor-4'-methyl-4-oxyazobenzol and 2,4-dichlor-4'-oxyazobenzol which proved most effective in relation to yeastlike molds and dermatophytes and weakest in relation to bacteria. TITLE	: The Viability of the Conidia of the Apple Tree Scab <i>Fusicladium dendriticum</i> Fuck
ORIG. PUB.	: Mikrobiol. Zh., 1958, Vol.20, No.1, 6-7
ABSTRACT	: It has been shown that the spores of <i>F. dendriticum</i> do not lose viability and are capable of sprouting in the spring after passing the winter in the leaves of the tree. They are the primary source of infection even before the dissemination of the ascospores. Conidia from leaves and iolioses kept in herbaria for more than 9 months sprouted in a moisture chamber. Early spring spraying of apple trees with a concentrated solution of fungicide is recommended in the case of trees with non-deciduous foliage. -- G.A.D'yakova

6958. (1468) NEW METHODS OF MANUFACTURING ORTHOPAEDIC APPARATUS FROM POLYESTER RESINS - Nowa metoda sporządzania aparatów ortopedycznych z żywicy poliestrowej - Frankowski A. Kraków - TWORZYWA-GUMA-LAKIERY 1958, 8/3 (176-178) Tables 1 Illus. 2

A description is given of an original method of manufacturing orthopaedic apparatus from polyester resins directly on the subject's body. Prostheses prepared in this manner fit much more accurately than those prepared in the old way, using plaster casts. The results obtained up to now, particularly with foot supports, have been satisfactory.
