Title : Local Plum Varieties in the Dimbovitai Valley.

Orig. Pub. : An. Inst. cercetari agron., 1957, 24, No. 5, 413-423

Abstract : Fourteen local plum varieties and three clons from the Dimbovitai Valley are described by the Voinești Experimental Horticultural Station. Fruit from the local plum varieties having an average size are distinguished by higher acidity and larger pits when compared with the fruit size; the pits in the majority of varieties grows together or at least partially grows together with the flesh, the gustatory qualities of the fruit is generally not high. The most widely distributed varieties in

Abstract : Dimbovitai Valley are: Roshior veretik and Negru - which are characterized by constantly high yielding capacity and early maturity; Negru trees are tall and reach about 100 years of age; the Skoldush, Gelbior and Gelbior Mik varieties are short and short-lived. The high yielding Gytlan variety produces a superb quality when it is dry. Many clons of the Roshior Veretik plum are distinguished in Dimbovitai, the basic ones of which are: Roshior or Veretik Mare with very large low quality fruit,

Title : Mass Analysis in a High Frequency Ion Source for a Van de Graaff Accelerator.

Orig Pub : Repts "J. Stefan" Inst, 1956, 3, 87-94

Abstract : The authors describe an improvement in a high frequency ion source (Referat Zhur Fizika, 1957, No 11, 27103), which makes it possible to improve the focusing of an ion beam and to carry out a mass analysis with superposition of additional longitudinal magnetic field of approximately 70 gauss. The flow of gas in this source is at the upper of the limits indicated in the literature.

Title : Final Implementation and Results of the Measurement of a High Frequency Ion Source in a Van de Graaff Accelerator.

Orig Pub : REpts "J. Stefan" Inst., 1957, 4, 117-122

Abstract : By washing the discharge tube with a 5% solution of hydrofluoric acid the fraction of the protons in the ion gun increases from 32 to 48%. Reduction in the area of the metallic surfaces and washing the tube with 10% solution of hydrofluoric acid made it possible to increase the proton component to 76%. Under the optimum conditions (pressure in the tube 8×10^{-5} mm mercury, intensity of magnetic field 175 gauss, clearing voltage 2 kv, generator power 46 watts), a current of 118 microamperes (85%) H_1^+ , 17 microamperes (12%) H_2^+ , and 4 microamperes

"Tests of Vitamin-A Content in Cattle Serum under Winter Feeding Conditions on Certain Farms."

Belgrade, Veterinarski Glasnik, Vol 17, No 3, 1963, pp 247-248.

Abstract: The average amount of Vitamin A in cattle is taken (after Alorittson, 1955) to be 24 gamma per 100 milliliters of plasma or serum. The amount found in cows on two state farms in winter where feed was of poor quality was 16 to 20 gamma; on four such farms with better-quality feed, 27 to 45 gamma. The author concludes that improper winter nutrition leads to a decline in Vitamin-A concentration in the blood serum of cows and, on the basis of his observations, that there is a direct correlation between Vitamin-A deficiency and gastrointestinal ailments in calves. References to six recent works.

TITLE: The precision of determining (the position of a point) by the polar and orthogonal methods

PERIODICAL: Referativnyy zhurnal. Astronomiya i Geodeziya, no. 1, 1962, 11-12, abstract 1667 ("Tehnika", 1961, v. 16, no. 9, "Nase gradev", v. 11, no. 9, 213-216, Serbo-Croatian, French summary)

TEXT: In a general case, when point B (see Fig.) is a pole and lies on the given straight line OA at a distance $OB = c = x$ from point O, the precision of determining the position of Point P is characterized by the following mean-square errors: in direction of the X-axis

$$M_{px}^2 = (\mu c)^2 + \frac{e^2}{4} \cdot \frac{a^2 + o^2}{(a + c)^2} [1 + (\frac{b}{a} \sin \alpha)^2] +$$

$$+ (\frac{b \cdot m \alpha}{\rho} \sin \alpha)^2 + e^2 (\frac{b}{a} \sin \alpha)^2 + (\mu_i b \cos \alpha)^2 + m_p^2$$

Card 1/4

S/035/62/000/001/021/038
A001/A101

The precision of determining ...

in direction of the Y-axis

$$M_{py}^2 = \frac{e^2}{4} \cdot \frac{a^2 + c^2}{(a + c)^2} \left[1 + \left(\frac{b}{a} \cos \alpha \right)^2 \right] + \left(\frac{b \cdot m_\alpha}{\rho} \cos \alpha \right)^2 + e^2 \left(\frac{b}{a} \cos \alpha \right)^2 + (\mu_1 b \sin \alpha)^2 + m_p^2$$

In these expressions e are linear errors of centering theodolite in points O, B and of mounting landmarks in points A and P, μ and μ_1 are coefficients of random effect in measuring distances c and BP = b, α is position angle, m_α is its mean-square error, ρ is radian, m_p is mean-square error of denoting point P. The circumstance that determination of point positions by the polar method is performed with a comparatively low precision, makes it possible to consider the error in position of point B to be equal to an error in measuring distance c. Then

$$M_{px}^2 = (\mu c)^2 + e^2 \left(\frac{b}{a} \sin \alpha \right)^2 + \left(\frac{b \cdot m_\alpha}{\rho} \sin \alpha \right)^2 + (\mu_1 b \cos \alpha)^2 + m_p^2$$

Card 2/4

S/035/62/000/001/021/038
A001/A101

The precision of determining ...

$$M_{py}^2 = e^2 \left(\frac{b}{a} \cos \alpha\right)^2 + \left(\frac{b \cdot m \alpha}{\rho} \cos \alpha\right)^2 + (\mu_1 b \sin \alpha)^2 + m_p^2$$

Consequently, the greatest effect on precision of determining the position of point P is exerted by the lengths of distances b and a and by errors in their measurement. If point O is the pole, then

$$M_{px}^2 = e^2 \left(\frac{b}{a} \sin \alpha\right)^2 + \left(\frac{b \cdot m \alpha}{\rho} \sin \alpha\right)^2 + (\mu_1 b \cos \alpha)^2 + \frac{m_p^2}{2}$$

$$M_{py}^2 = e^2 \left(\frac{b}{a} \cos \alpha\right)^2 + \left(\frac{b \cdot m \alpha}{\rho} \cos \alpha\right)^2 + (\mu_1 b \sin \alpha)^2 + \frac{m_p^2}{2}$$

The total error in the position of point P has the value

$$M_p^2 = \left(e \frac{b}{a}\right)^2 + \left(\frac{b \cdot m \alpha}{\rho}\right)^2 + (\mu_1 b)^2 + m_p^2$$

The expressions given for errors M_{px} and M_{py} can be used also for estimating the precision of determining the position of point P by the method of perpendiculars; in this case $\alpha = 90^\circ$ and $b = y$. If positions of several points are determined from one pole, the value of the mean square error in the position of the n-th

Card 3/4

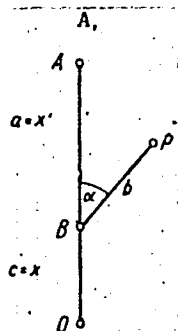

S/035/62/000/001/021/038
A001/A101

The precision of determining ...

point is as follows:

$$M_{pn}^2 = \left[\left(\frac{be}{a} \right)^2 + \left(\frac{bm \alpha}{\rho} \right)^2 \right] \cdot \frac{n(n+1)(2n+1)}{6} + n \left[(\mu_1 b)^2 + m_p^2 \right].$$

"The Role of Exenteration of the Orbit Today"

Belgrade, Srpski arhiv za celokupno lekarstvo, Vol 93, No 9, Sep 65, pages 781-790.

Abstract [Authors' English summary modified]: The authors analyze the indications, operative techniques and results in exenteration of the orbit carried out in 83 patients over a ten-years period (1955-64). Basic indications of the disease were connected with different malignant processes whose evolution did not permit other operative and therapeutical procedures. Most of the patients had had this tumor for over a year and many of them more than ten years. Visual acuteness was limited to amaurosis or light projection. Increased sedimentation was noted in 50% of the cases. The reaction of the urine to melanin and melanogen was negative. More than 50% survived the operation up to 2 years, 12 up to 5 years, and only 6 survived over six years. The radical exenteration with the removal of eye-lids should always be carried out. In most cases blood transfusion and X-ray treatment are ne-

Belgrade, Medicinski Glasnik, Vol 16, No 10-12. Oct-Dec 1962: pp 434-437.

Abstract: Data on 55 patients seen in 10 years. Main differences with
classical concepts are the relatively young average age (of the 45 for
which full data are available, 9 were below 40, another 9 between 40
and 50 years old;) a third had normal blood pressure. Most came quite
late during the course of progressive vision loss, so that treatment
(anticoagulants, vitamins, Ca, vasodilators, antibiotics) had little
chance of true success. Secondary glaucoma appeared in 5. Four tables,
7 Western and 2 Yugoslav references.

"Parasites and Parasitic Diseases Affecting Geese Thus Far in Yugoslavia in Extensive Raising and the Problems to Be Anticipated in Intensive Raising."

Belgrade, Veterinarski Glasnik, Vol 17, No 3, 1963, pp 275-279.

Abstract: [Author's Serbo-Croatian summary] The following parasitic diseases might be expected to appear in intensive goose raising under specific conditions of maintenance and nutrition, as well as under specific meteorological conditions: trichomoniasis in goslings three to four weeks old; coccidiosis in goslings one to two months old, rarely up to three months old; various ectoparasitoses in all categories of geese; amidostomosis in goslings, rarely in grown geese; other helminthoses (mainly several combined), primarily in goslings in subclinical but sometimes clinical form. References to 21 Yugoslav recent works.
