TITLE: Universal assembled appliances at the heavy lathe plant

PERIODICAL: Referativnyy zhurnal, Tekhnologiya mashinostroyeniya, no. 2, 1962, 17, abstract 2B67 (Fertigungstechn. und Betrieb, v.12, no. 7, 1962, 455-457, German)

TEXT: The people's own plant imeni 8th of May in Karl-Marx-Stadt (GDR) manufacturing heavy lathes, uses extensively in its shops universal assembled appliances. In the city there is a lease center for universal assembled appliances. On the basis of the design drawing and taking into account the technological process adopted at the plant for an element (or a group of elements) the lease center constructs the universal assembled appliance and delivers it to the customer in 2-8 days. For each appliance a card is made out where technical data and order number are entered as well as the information relating to the economy achieved by the plant by using this appliance. The first workpiece is processed at the plant in the presence of the workshop technologist after which it is controlled.

Card 1/2

Universal assembled appliances...

S/276/63/000/002/004/052
A052/A126

The technologist is responsible for the execution of the whole series of operations with the use of this appliance. The application of universal assembled appliances with high-speed clamps and changeable plate jigs on vertical drilling machines is effective. The application of universal assembled appliances is effective also on milling machines since besides single-seat universal assembled appliances also multi-seat units with high-speed clamps are used. There are 2 figures and 2 tables.

ORIG. PUB.	:	Chem. analit., 1958, 3, No 3-4, 495-500	
ABSTRACT : On determination of traces of Pb and Cu in Fe-Cd paste used in the manufacture of alkaline storage batteries, the sample (5 g) is dissolved in 30-40 ml HNO_3 (1:1), resultant solution (together with small amount of precipitate) is diluted with water to 50 ml and thoroughly stirred. If content of Pb and Cu in the paste is at least of 0.005%, 5 ml of the settled solution are placed in a separatory funnel into which are added 10 ml ammonium citrate solution (50 g citric acid dissolved in 50 ml water and 50 ml 25% NH_4OH), 10 ml concentrated NH_4OH and 5 ml 0.2% solution of Na-diethyldithiocarbamate (I). If content of Pb and Cu is less than 0.005%, 20 ml of the solution

ABSTRACT : are taken and there are added to it a 4-fold amount, respectively, of each of the above-stated reagents. Then, extraction is carried out with CCl_4 (by increments of 20 ml), adding each time 5 ml of 0.2% solution of I. The extracts are combined and are shaken with 30 ml 10% solution of ammonium citrate (to remove the partially extracted Fe^{2+}). After separation of the aqueous layer the extract is shaken with 30 ml HNO_3 (1:1) (to remove Pb and Cu) and the aqueous layer is separated. This extraction of the organic phase with a solution of HNO_3 is repeated 2 more times. The acid extracts so obtained are combined and evaporated to dryness on a water bath, and dissolved in 10 ml of a solution 2 N in CH_3COOH and 2 N in $\text{CH}_3\text{COONH}_4$; N_2 is passed in and polarography is carried out.

AUTHOR: Cyranowicz, Kazimierz

TITLE: Ceramics possessing high mechanical strength for
high voltage insulators

PERIODICAL: Szkło i Ceramika, no. 12, 1962, 374-386

TEXT: A summary of one of the 6 lectures given at a seminar held under the auspices of Instytut Elektrotechniki (Institute of Electrical Technology) at Warszawa-Miedzylesie in June 1962. The seminar was attended by representatives of Akademia Górnictwo-Hutnicza (Academy of Mining and Metallurgy), Politechnika Warszawa (Warsaw Polytechnic Institute), Politechnika Śląska (Silesia Polytechnic Institute) etc. and was presided over by Prof. Dr. L. Winogradow, Head of Katedra Technologii Porcelanu A.G.H. (Department of Porcelain Technology of the A.G.H.). A review is first given of the methods by which the mechanical strength of ceramic insulators may be improved, discussing the problem under (a) improved construction (shape) and (b) improved quality of the ceramic. Section (b) is subdivided into con-

Card 1/2

Ceramics possessing high mechanical ... D204/D307

siderations of the mineralogical and granulometric compositions, firing temperature and the amount and nature of the glassy phase. Special attention is paid to the effect of quartz and of alumina on mechanical strength. The work on the improvement of the latter property by enriching the ceramic in Al_2O_3 , carried out at Zakład Wyso-
kich Napięć Instytutu Elektrotechniki (High Voltage Establishment of the Institute of Electrical Technology), is then described [Abstract]. Author's note: It is not clear whether this is the author's own work. It was found that mechanical strength may be raised by ~ 50% by increasing the total Al_2O_3 content to ~ 45%. To keep the firing temperature low (~ 1250°C), ~ 20% of low-firing plastic clays was added to each composition. The increased Al_2O_3 contents led to a considerable rise of the mullite content in the final mass. A composition is suggested for insulators exposed to high mechanical stress. Further work should be concerned with pre-treating the alumina before it is added to the ceramic mass, studies of the firing mechanisms of such composition, and utilization of porcelain wastes. There are 18 figures and 8 tables.

ACCESSION NR: AP4016457

P/0015/64/000/001/0016/0026

AUTHOR: Cyranowicz, Kazimierz

TITLE: Results of attempts at the synthesis of enstatite

SOURCE: Szkło i ceramika, no. 1, 1964, 16-26

TOPIC TAGS: enstatite, ceramic insulator, steatite, talc, magnesium metasilicate, silicon dioxide, dielectric loss, dielectric dissipation factor, magnesium silicate, mineralizer, magnesium carbonate, magnesite, quartz sand, magnesium oxide, barium oxide, barium carbonate, potassium oxide, sodium oxide, aluminum oxide, calcium oxide

ABSTRACT: The purpose of the work was to attempt a synthesis of enstatite, to investigate the course of this synthesis by using a series of mineralizers added with the aim of lowering the sintering temperature, and to study the relationship between the extent of reaction of the substrates participating in enstatite synthesis and the basic technological parameter of the steatite masses, i.e., the temperature range of sintering. The results obtained confirmed the desirability of using mineralizers, since the temperature of the synthesis can be lowered from 1400 to 1300°C, the degree of combination of MgO in the product being the same.

Card 1/2

ACCESSION NR: AP4016457

The investigated effect of several mineralizers on the synthesis of magnesium silicate makes it possible to select mineralizers for various synthetic steatites. It is desirable to try to synthesize enstatite with a higher content of MgO in order to raise the content of magnesium metasilicate (by tying up one free SiO₂ molecule) in order to raise the mechanical strength of the finished material.

TITLE: Operating conditions and characteristics of a ceramic material which is
resistant to a brief exposure to an electric arc

SOURCE: Szklo i ceramika, no. 8, 1965, 228-233

TOPIC TAGS: ceramic product property, electric arc, spark gap, ceramic product

ABSTRACT: The paper discusses the operating conditions and characteristics of
ceramic materials used in the extinguishing chambers of circuit breakers
and lightning conductor spark gaps. The methods of extinguishing electric arcs
in AC and DC circuit breakers are briefly reviewed. The following topics are
discussed: The energy released during the process of extinguishing an arc.
The method of extinguishing an arc by its elongation. Voltage and current
characteristics of an arc in a lightning conductor spark gap during the process
of extinguishing. The requirements of the materials for the wall of narrow-slot
type extinguishing chambers (thermal, chemical, and mechanical properties). The
porosity of the wall surfaces of extinguishing chambers. Manufacturing tolerances

Cord 1/2

5

of extinguishing chambers. The available ceramic materials are reviewed from the standpoint of their usefulness for the fabrication of arc-resisting chambers. The mechanical and thermal properties of the following ceramic materials are discussed and presented in a table: fire/clay, steatite, cordierite, corundum, and zirconia. It is noted that zirconia meets almost all requirements required from materials for manufacturing arc-resisting walls (high thermal conductivity and chemical resistance). Some other non-ceramic materials are also briefly discussed. Orig. art. has: 3 figures and 1 table.

TITLE: Composition and Technology Tests of High-Voltage Porcelain ✓

PERIODICAL: Przegląd Elektrotechniczny, 1960, No. 6, pp. 227 - 231

TEXT: A brief description of tests for improvement of insulating porcelain performed in the Zakład Wysokich Napięć (High-Voltage Section) of the Zakład Materiałoznawstwa Instytutu Elektrotechniki (Material Research Division of the Electrotechnical Institute) is given. The purpose was to find a porcelain body with better mechanical properties than required in Polish Standard PN-56/E-06301 and in German Standard DIN 40685 (1957), listed in Table I. The influence of the porcelain-body composition on its properties is discussed and shown in 2 relation triangles (Figs. 1 and 4) introduced by G.J. Gilchrist and T.A. Kline-felter (Ref. 1) and by Wiedmann (Ref. 13), respectively. The influence of the size of quartz granules in the porcelain body on its tensile strength is discussed and shown in 2 macrophotographs (Figs. 2 and 3). Mechanical properties of No. 31, No. 32 and No. 5 porcelain bodies, which are being produced in an unspecified Polish plant are given in Figure 5 and Table II. There are 5 figures,

TITLE: Construction and properties of a small ion-sorption pump

PERIODICAL: Przegląd Elektroniki, no.6, 1962, 309-311

TEXT: A new type of small ion-sorption pump called PTJ-4 has been constructed. Its power consumption was 6-8 W, therefore no artificial cooling was needed. Weight of the pump about 40 grams. A schematic picture shows the pump having a glass ellipsoidal enclosure. The small power consumption was achieved by use of titanium in the form of a pill of a small geometrical size.

Card 1/2

P/053/62/000/006/002/009

Construction and properties of...

face and therefore the necessary power for titanium heating was decreased to a minimum. Evaporation of titanium was achieved by heating the pill to 1100°C. The pumping speed was measured at pressures 10^{-7} up to 10^{-5} mm Hg and at powers supplied to titanium 3W, 4W, 5W and grid current 3mA. At 10^{-7} Hg pumping speeds are similar for the three wattages, at higher pressures they become significantly different. The lifetime of the pump at 4W is 650 hours and 3W-4600 hours. At an increase of grid current from 1 to 8 mA, pumping speed increases 25%. After careful outgassing, a pressure of 10^{-9} Hg in a container of 5 litres has been achieved after 3-5 hours pumping. There are 4 figures.

TITLE: Miniature ion-evaporation pump

PERIODICAL: Československý časopis pro fysiku, no.5-6, 1962,
647-649

TEXT: The pump consists of four electrodes sealed into a glass bulb of ellipsoidal shape. In the centre there is a hot tungsten cathode and near it, on a tungsten wire, a titanium tablet is fixed which is evaporated by heating to 1100 °C by electron bombardment. The gas is ionized in a cathode grid ionization system; a thin aluminium layer deposited on the inside of the bulb and joined to a contact sealed into the glass forms the ion collector. The input end of the pump is protected by a plate. A voltage, controlled between the limits of 0 and 3.5 V, is applied to the cathode and the tablet is connected to the grid through a resistance. During normal operation, the tablet has a potential of 500 V, the grid a potential of 200 V and the thin metal layer is at a potential of -10 V with respect to the cathode. The pumping rate was determined by the capillary method in the Card 1/2

Miniature ion-evaporation pump

Z/037/62/000/005-6/035/049
E073/E139

range 10^{-7} to 10^{-5} mm Hg at a constant speed of evaporation, which was controlled by regulating the power input to the tablet. In order to achieve the highest pumping rate at a given pressure the energy input to the tablet must be kept to a minimum. This minimum value increases with pressure, i.e. if the quantity of gases released by the vacuum system is above 10^{-1} mm Hg.litre/sec, 4W are required; for smaller quantities 3 W will suffice. The service life is 650 to 4600 hours depending on the power input. The measured pumping rates in pumping air, nitrogen, oxygen and hydrogen, using an input of 4 W, correspond to values obtained with other ion-sorption pumps, i.e. about 5 litre/sec at 10^{-7} mm Hg. In the range 10^{-3} to 10^{-7} mm Hg the ion current varies linearly with the pressure under normal operating conditions and, therefore, the pump can be used as a pressure gauge with a sensitivity of 50 mm Hg $^{-1}$. The pump proved particularly useful for evacuating the thermocouple chamber of an infrared spectrophotometer.

There are 4 figures.

TEXT: Rigid fixing of collector electrodes causes bending,
giving rise to discharges and short circuits. Such electrodes are
difficult to rap. Collector electrodes are proposed which are
collected into vertical bundles suspended from an upper frame and
maintained in the vertical position by a lower frame connected to
their ends. The bundles may be straight or otherwise, and may also
consist of individual elements fixed like chains. Collector
electrodes of honeycomb shape may be built up of combinations of
such bundles. Sketches are given of several variants of electrodes.

AUTHOR: Cytowski, H.

TITLE: Application of "astralon" and technique of drawing

PERIODICAL: Referativnyy zhurnal. Astronomiya i Geodeziya, no. 1, 1962, 25, abstract 1G176 ("Przegl. geod.", 1961, v.33, no.7, 263-265, Polish)

TEXT: The author points out that application of astralon became practically feasible only as a result of developing the methods of drawing on this material and of the method of fixing figures drawn on astralon by coating the latter with a varnish using a light sprayer. He describes in detail the methods of working on astralon, equipment and materials used for this, and recommends the technique of work.

AUTHORS: Przanowski, Ryszard and Cywiński, Józef

TITLE: Electronic equipment for electrotherapy by low-frequency currents

PERIODICAL: Referativnyy zhurnal, Avtomatika i radioelektronika,
no. 12, 1962, 6, abstract 12-5-12 b (Polish pat., cl.
21g, 24/02, no. 45188, Jan. 16, 1962)

TEXT: The object of the patent is an apparatus for electrotherapy with MF, DF, CP, RS, LP and MM type diodynamic currents, which can be superimposed on a galvanic current. The voltage values of the diodynamic and galvanic currents are monitored by two measuring instruments. The selection of current type is accomplished by a key switch. The form of the output voltage is observed on a CRT screen; the sweep voltage across the horizontal deflecting plates of the CRT is provided by a phantastron generator, while the vertical-deflection plates are connected to the output of the pulse-shaping stages. The shaping of LP and MM type pulses having a pe-

Card 1/2

Electronic equipment for ...

S/194/62/000/012/056/101
D295/D308

riod of several seconds is accomplished by a potentiometer with an angle of rotation of 360°, driven by a synchronous motor with a reduction gear. The shaping of MF, DF, RS, CP and LP type pulses with ~10 msec period is accomplished by a reference-diodes stage, whilst pulses of 1 sec duration and 2 sec repetition frequency are provided by a multivibrator. Before proceeding with treatment, an instrument accomplishes the automatic measurement of the electric resistance of the patient's body. A three-position switch ensures the instantaneous reversion of the polarization current. The current sources in the circuit are two pentodes, the anode load of which is the patient's body. One of the pentodes is the galvanic-current source and the other the low-frequency current source.

TITLE: Electronic pH meter

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 24, 1962, 509-510,
abstract 24I289 (Polish Patent 44526, June 24, 1961)

TEXT: The patent relates to a device with a measuring battery cell and a compensating bridge connected to the input of a two-stage asymmetric amplifier with galvanic coupling between the stages. The operating point of the amplifier's input electron tube is so chosen that the grid current passing through the liquid under examination does not rise above a given value (e.g. 10^{-12} a) at the moment of compensation. One arm of the bridge is formed by the anode resistance of the final tube, the other by an additional branch of the anode battery. The microammeter in the amplifier's measuring circuit is provided with a center-zero scale. Temperature compensation allows of using the device in the 0 - 40°C range. Proper selection and assembly of the units gives an accuracy of 0.005 pH in the pH 1 - 9 range and 0.2 mv \pm 0.05 % with a 10^{12} ohm amplifier input.

Card 1/2

Electronic pH meter

S/081/62/000/024/055/073
B166/B186

impedance. The device is designed for electrodes having zero potential at pH 1.8. The required power is negligible: a set of supply batteries is sufficient for 6 months. The high input impedance enables high-resistance measuring batteries to be used. [Abstracter's note: Complete translation.]

Title : Remarks Concerning Determination of the Stability of
Butter

Orig Pub : Przem. spozywczy, 1955, 9, No 5, 212

Abstract : The official method adopted in Poland for evaluation of
the stability of butter prior to storage is based upon
the following factors: determination of acidity of
plasma and a numerical scoring system of assessing the
taste and odor. These criteria are not sufficiently
reliable and the author proposes to determine the dura-
tion of the induction period according to Zaykovskiy, or
distribution of water in the butter according to King.

Title : Agrobiological Studies of Castor Plant.

Orig Pub : Biul. Panstw. inst. nauk. leczn. surow. rosl. Poznania,
1956, 2, No 2, 61-75

Abstract : It was determined in experiments on castor plant carried
out in vicinity of Poznan' that the best time for plant-
ing is the period 20 of April - 10 of May. The greatest
yield is obtained with heavier planting although this
leads to a decrease in the essential quality of the
grain. Application of fertilizers produces positive re-
sults only in years favorable in climatic respect. In
unfavorable years the effect of fertilizers decreases and

Card 1/2

Abs Jour : Ref Zhur Biol., No 18, 1958, 82446

light and temperature conditions come to the forefront. Nitrogen fertilizers produce a great influence on the quantity and quality of the yield. A good effect on castor plant yield is produced by organic fertilizers. This effect is especially considerable in unfavorable years. Potassium produced a mild effect. Fertilizing with squeezings noticeably lowered the quantity and quality of the crop. No correlative relation between the amount of any kind of fertilizer, the percentage of oil content in the seeds and the degree of its acidity was discovered. -- V.F. Nepomiluyev
