Abstract : Experiments were performed with 12 bulls which
 were half-brothers and 12 heifers (6 animals of
 each sex were in the experimental and in the
 control group). The experiments lasted for
 bulls 10 days to 22 weeks and for heifers up
 to 18 weeks. Animals weighing 50-75 kg received
 2 g of oxytetracycline (OTC), which was followed
 by an additional dosage of 1 g per each 25 kg,
 until at a weight of 175-200 kg the OTC dosage
 reached 7 g. The preparation contained 17.5 mg

 Abstract : of OTC-tetramycin (T) per 1 g. As an abundant amount of milk (500 l of whole and 800 l of skim milk) was used in feeding, T did not produce any effects upon either the weight gains nor the fodder expenditures. In the group of heifers, the addition of T to fodder saved about 175 l of milk or about 7 kg of butter per calf. In the experimental group, the utilization of fodder in terms of starch units increased by 22 percent, while the hay consumption rose by 12 percent. -- V. A. Kanzyuba

 TITLE : Experiments Pertaining to the Application of Syntestrin for Improving the Fattening of Cattle.
 ORIG. PUB. : Allattenyesztes, 1957, 6, No 4, 265-272
 ABSTRACT : Fifteen to 20 mg of syntestrin (acts as an ovary hormone, estrone) were added to the fodder of each animal (a total of 253 heads) daily in the form of a capsule. During the course of the 66 days of the experiment, the animals of the experimental group manifested a 14.2 kg larger weight gain in comparison to the control group. In studies arranged according to sex, the largest weight gain of 25.3 kg was observed in bulls, whereas in cows it amounted to only 21 kg.

Ore dressing for the silicon-thermal magnesium reduction. Andor Szilygesszy and Károly A. Czako. *Fémipari Kutató Intézet Közleményei* 1956, 310-30. For calcining, the grain sizes may vary from 10 to 70 mm. without affecting the calcining time. The optimum temp. for reducing the CO₂ content of the material to the desired 0.5% is reached in stages from 650 to 1200°. For briquet formation, the dolomite must be ground to a grain size of 0.60-1.0 mm. and pressed with a specific pressure of 800-1000 kg./sq. cm., after which the apparent d. of the briquets is 1.7-1.8 g./cc. The pressure needed for wet briquetting is only 1/5-1/4 of that required for dry pressing. At a drying temp. of 650° the oxidation of the 75% FeSi is negligible in both the wet and the dry briquets, while somewhat larger in the wet briquets. The drying temp. should not exceed 750-800°.

Title : The Spectroscopic Determination of Trace Amounts of Lithium in Metallic Calcium.

Orig Pub : Chem Analit, 2, No 3, 245-248 (1957) (in Polish with Summaries in English and Russian)

Abstract : A simple and rapid method has been developed for the determination of Li; the method is applicable to the analysis of samples which do not contain K. Procedure: 0.5 gm of the calcium to be analyzed is treated with water, the solution is evaporated, and the residue is ground in a mortar. About 0.05 gm of the substance obtained is placed in the hollow tip of the bottom electrode. Cu-electrodes are used: the lower electrode has a diameter of 6 mm with an opening 5 mm in diameter and 5 mm in length. The spectra

 Institut. :
 Title : Spectrographic Determination of Trace-Amounts of Boron and Silicon in Ammonium Fluoride.
 Orig. Pub. : Chem. analit., 1957, 2, No 5, 426-435

Abstract : Analysis is carried out by the method of addition, on excitation of spectra in an alternating current arc at 20 a. Spectra are photographed in a medium spectrograph. On assuming that γ of plate, and exponent in the formula $I = ac^b$, are equal to 1, the unknown concentration is found on the calibration graph plotted with coordinates $C_x, (A_f / A_{1+f}) - 1$, where A_f -- magnitude of deflection of galvanometer mirror on measurement of background blackening; A_{1+f} -- same, for line. On determination of B at concentrations $5 \cdot 10^{-5} - 3 \cdot 10^{-4}\%$, the analyzed NH_4F is converted to NaF. The sample is divided in 4 parts and 3 of these are combined, respectively, with 2.4 and 8 ml of H_3BO_3 solution

Title : Spectrographic Method of Determining Traces of Lithium in Metallic Calcium by the Spark Method

Orig Pub : Chem. analit., 1958, 3, No 1, 9-12

Abstract : A spectral method is proposed for determining traces of lithium in metallic calcium. The determined region of concentrations of lithium is 3 to 10×10^{-6} . The reproducibility of the results, calculated by the formula $\nu = t \propto (\bar{s}/x) \times 100\%$ is equal to approximately $\pm 4\%$ for $p = 95\%$. A high power spark from a 10 kw generator was used. The specimen in the form of CaCl_2 , pressed with graphite, served as the lower electrode; the upper electrode was

AUTHOR: Czakow, Julian

TITLE: Spectral determination of impurity traces

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 2, 1963, 119, abstract
2621 (Chem. analit. (Polska), v. 7, no. 2, 1962, 291-300
[Pol.; summary in Eng.]

TEXT: This article is a review. It discusses ways of enhancing the sensitivity of emission spectral analysis in direct and combined (with preliminary enrichment) determination of impurities in pure materials. 29 references. [Abstracter's note: Complete translation.]

Title : Cables, Insulated by Plasticized Polyvinylchloride.

Orig. Pub. : Przegl. elektrotechn., 1958, 34, No. 7, 348-354.
Abstract : The qualities of polyvinylchloride (PVC) used for the insulation (I) and wrapping (W) of cables (C) were examined. It was noted that the best material for I is PVC, produced by the suspension method. It insures excellent water resistance and best dielectric properties of I and W, and is applied to C calculated for a voltage of up to 10 and, in some cases, of up to 20 kv. The structure, exploiting properties and the methods of testing C in W and I from the polyvinylchloride masticated rubber (PMR) and also the characteristic

fractions. The experimental results show that: 1) a complete determination of BeO₂ content in glass requires only 23 min, and the suggestion is made that

source to ensure accurate determinations; and 2) the coarse-grain and fine-grain fractions are most porous, the mixtures most densely packed are less porous, and the cast glass has no porosity. It is suggested that glass powder of the selected sample, passed through a sieve with apertures of 0.2 mm, be used for ~~SALES AND OTHER PURPOSES~~, and cast glass samples 17 mm in ϕ and 20 mm in length be used in glass-making plants and in glaze and enamel departments.
