EXCERPTA MEDICA Sec.13 Vol.9/11 Dermatology Nov 55

2304. DARABOS L. and FÜLÖP J. *Adatok a króm-allergiához. II. Ipari börszürővizsgálatok a palagyárban. Data on chrome-allergy. Series of skin-examinations in a slate-factory BÖRGYÓGY. VENER. SZLE. 1954, 30/5 (142-146) Tables. 3

The workers in a slate factory were examined clinically and by contact tests. The reactions were as follows: with cement 37.6%, with chrome 8.4%, with turpentine 7.7% positive. The sensitization to chrome in cement-positive cases was twice as frequent in women. The chrome-positive cases also gave positive reactions with cement in 75% of cases. In the period of the examinations other workers had other skin diseases as well. In others the anamnesis was positive. In eczema patients the contact tests to chrome were also positive. Among all workers the 'latent' sensitization to chrome was positive in 1.5%. Vámos - Budapest

TITLE: KOD apparatus for multichannel digital recording of seismic signals

SOURCE: AN SSSR. Institut fiziki Zemli. Vychislitel'naya seysmologiya, no. 2, 1966. Mashinnaya interpretatsiya seysmicheskikh voln (machine interpretation of seismic waves), 183-195

TOPIC TAGS: digital seismic signal recorder, digital analog converter, seismologic instrument, seismologic station, seismograph, signal recording

ABSTRACT: The KOD digital recorder, which incorporates a device for on-the-spot analog-to-digital conversion and multichannel recording of seismic observations on magnetic tape, was developed at the Institute of Physics of the Earth, AS USSR. Three to five KOD sets, each installed at a separate seimic station, can provide round-the-clock recordings for computer-ized analysis at the main station. The set consists of the following principal components (Fig. 1): seismic signal pickups (1); amplifiers (2) for raising the signal level high enough

Card 1/3

ACC NR: AT6033697

1 – Pickup; 2 – amplifier; 3 – multichannel analog-to-digital converter; 4 – time service; 5 – radio receiver; 6 – magnetic recorder; 7 – visual recorder; 8 – control unit; 9 – power supply unit; 10 – recorded tape; 11 – magnetic reproducer; 12 – magnetic transcriber; 13 – multichannel digital-to-analog converter; 14 – loop oscillograph (I – III ---- station numbers).

Card 2/3

ACC NR: AT6033697

for conversion to a binary code -- the number of amplifier channels corresponds to the number of X, Y, and Z components of the recorded signals; multichannel analog-to-digital converter (3); time recorder (4) for subsequent integrated analysis of material from a number of stations; radio receiver (5) for reception of the exact-time signals; magnetic recorder (6); visual-monitoring recorder (7); control unit (8) power source (storage battery) (9). The recorded tape (10) is transmitted to the main station where it is selectively transcribed from a magnetic re producing unit (11) onto another magnetic recorder (12), while at the same time providing a visual trace, decoded by a multichannel digital-to-analog converter (13) and recorded by an oscillograph (14). Signals within the frequency range of 0.03-5 cps (33-0.2 sec) are recorded. This set, designed for continuous round-the-clock operation, requires the following daily servicing operations: 1) replacement of magnetic-recorder tape, 3 times daily; 2) adjustment of quartz clock, 2 times daily, according to exact-time signals transmitted by radio; 3) checking the performance of the data converter by visual monitoring of oscillograph screen; 4) calibration of amplifier and control units. All measurement results are recorded on the station log. Orig. art. has: 5 figures, and 2 tables.

TITLE: Practical utilization of electromechanical filters in electrodynamic seismographs with galvanometric recording

SOURCE: AN SSSR. Institut fiziki zemli. Trudy, no. 35, 1964, 110-132

TOPIC TAGS: electric filter, seismograph, seismography, galvanometer, galvanometry, seismologic instrument, electronic amplifier

ABSTRACT: The authors discuss two groups of circuits which can be used to connect a capacitor into the galvanometer-electromechanical filter circuit of a seismograph to increase the sensitivity and recording range. Final formulas (without analytical derivations) are given for determination of the magnitudes and frequency characteristics of a seismograph. In the first group, the capacitor is connected into a free coil in the seismometer (4 variations); the second group (4 variations) differs from the first in that no capacitor filter is used. A test run in 1962 with an apparatus consisting of three SK-III-M-type seismographs and M-17/12 galvanometers (new coils were

Card 1/2

L 5160-66
ACC NR: AT6000092

double-wound) indicated that the level of microseismic noise was too high. The same seismographs were used with M-17/6-type galvanometers connected in series with the main galvanometers and their magnetic shunts to control filter resonance. A filter wave trap (4.5—5-sec period) considerably lowered the microseismic noise level in the 3—7-sec range without decreasing sensitivity for periods of 10 sec or more. Additional experiments were carried out with a photo-optical electronic amplifier and low-frequency filter (schematics for connecting electromechanical filter and photoelectric amplifier are shown). / Orig. art. has: 13 figures, 3 tables, 42 formulas. The Effect of Temperature on Mould Filling in the Casting of Lead-Antimony Alloys. V. P. Mashovets and I. I. Daragan. Sbornik (*Laborno Proizvodstvo*, 1953, (2), 19-31).—[In Russian.] A special test was used to study the effect of mould and metal temp. on the fluidity of 4 alloys contg., resp., Sb 3·5, 6·25, 9, and 13%, remainder Pb. The test mould was made in cast Fe and contained 8 vertical pyramidal cavities (from 1 to 5 mm. sq. at the base and 40-100 mm. long) all joined to a common gating system. The degree of filling of the moulds was used as an index of the fluidity of the alloy. The results show that the poorest fluidity is obtained with the alloy contg. Sb 6·25% and that the mould temp. can be better utilized to control the fluidity than can the metal temp.—V. K.

TITLE: An ultrasonic echo ranging level indicator. Class 42, No. 181327

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 9, 1966, 87

TOPIC TAGS: liquid level indicator, ultrasonic equipment, electronic measurement

ABSTRACT: This Author's Certificate introduces: 1. An ultrasonic echo ranging liquid level indicator containing reference and measurement units with pickups, a probe pulse generator, and a level readout unit connected to the measurement unit. The device is designed for improved accuracy and for matching the operating times of the reference unit, measurement pickup and readout unit. Connected between the reference and measurement units is a reference pulse distributor with outputs corresponding in number to predetermined points for beginning level measurement. This distributor may be made in the form of a controlled delay line. 2. A modification of this indicator in which the outputs of the reference unit and probe pulse generator are connected to a coincidence circuit with an output which excites the measurement pickup when one of the reference pulses is generated. This output is connected through the reference pulse distributor to the probe pulse shaper. 3. A

Card 1/2 UDC: 681.128.82

modification of this indicator for measuring liquid levels at various temperatures and densities without additional adjustment. The reference pulse distributor in the instrument is made in the form of a counter with decoder. 4. A modification of this indicator in which the reference pulse distributor is made in the form of a shift register.

Biogenic stimulants

"Effect on Biochemical Indexes of Plants of the Treatment of Seeds With Biogenic Stimulants Before Planting," A. Yu. Daragan-Sushchova, All-Union Inst of Plant Cultivation

"Dok Ak Nauk SSSR" Vol LXXXII, No 3, pp 469-472

In 1943-45, work by A. V. Blagoveshchenskiy et al (Cen Asiatic State U) showed that biogenic stimulants (I) are not proteins or hexone bases; that as a result of prolonged lowering of temp, redox

21IM11

DARAGAN-SUSHCHOVA, A. Yu.

processes predominate over hydrolytic ones. The conclusion was drawn that, on cooling of an organism, carboxylic acids (particularly dicarboxylic) accumulate. Their work demonstrated that succinic acid, cinnamic acid, or aspartic acid stimulate sprouting of seeds of leguminous plants and increase yields i.e., exhibit biogenic stimulant activity. Investigation of N metabolism showed that proteolytic enzymes are activated by I. This is in agreement with results described by Blagoveshchenskiy, V. P. Filatov, et al to the effect that proteolytic enzymes as well as catalase are stimulated by I.

USSR.

The effect of pre-sowing treatment of seeds with biogenous stimulators on the biochemical indexes of plants. A. Yu. Daragan-Sushchova. *Doklady Akad. Nauk. S.S.S.R.* 82, 469-72(1952).—D. compared the effect of soaking seeds of bean and pea plants in biogenous stimulators, aspartic acid, and succinic acid, as well as their effect on growth and accumulation of N (protein and amino), in seeds, roots, and stems. As found by previous workers, biogenous stimulators (including aspartic and succinic acids in most cases) caused increased growth and variable small increases in accumulation of N (especially protein N), and resulted in increased activity and quality of proteolytic enzymes and catalases. Stimulant effect of the 2 acids increased with decreasing concn., with 2 max.: *M*/3000–*M*/4000 and *M*/7000–*M*/8000. Biogenous stimulators were used at dilns. of 1:5 and 1:50, of which the latter was more effective. Enzymes from stimulated plants decompd. peptone in 24 hrs. as compared with 48 hrs. for controls. Cinnamic acid also stimulated the roots of bean plants. D. believed the biogenous stimulators to be related to carboxylic and dicarboxylic acids, in view of their effect on oxidation-reduction processes, and on growth in plants. A. W. D.

Title : Seasonal Modifications of the Chemical Properties of Certain Soils of the Vologodskaya Oblast'.

Orig Pub : Pochvovedeniye, 1957, No 7, 73-79

Abstract : Observations were conducted on sod - deeply-podzolic and sod-alluvial non-podzolic soils of a slightly loamy mechanical composition under the forest, under the meadow and under various agricultural cultivations. In lysonetric waters at a depth of 20 cm, there was noted an increase of the soluble humus from 5.7-14.3 mg/l in May to 21.2-34.4 mg/l in June and of nitrates from 4.8-9.7 mg/l in May to 26.9-33.2 mg/l in July. The maximum content of water-soluble humus, calcium and nitrates were

TITLE: An Acoustic Method of Gas Analysis

PERIODICAL: Zavodskaya laboratoriya, 1960, Vol. 26, No. 12, 1368-1369

TEXT: From the various methods basing upon the measurement of acoustic quantities, the authors chose the measurement of the change in the propagation velocity of acoustic oscillations in air under atmospheric conditions as depending on the change of the density of the gas-air medium effected by various impurities (especially CH_4). The physical basis of the method is the fact that the propagation rate of sound in a gas mixture is between the respective rates in the pure gases. The velocity of sound in a gas is expressed by the equation

$$V = \sqrt{(p/\varrho)\cdot\gamma} ,$$

where γ is the ratio of the individual specific heats, p the gas pressure, and ϱ the density. With a sound source emitting sound waves in the direc-

B020/B056

tion of the surface of the receiver which is located at a distance d from the sound generator, the relation $t_1 = d/V_1$ holds for the time required by the sound to cover this distance, where V_1 is the propagation rate of sound in the gas mixture. If another gas is used, the propagation rate is V_2, and in that case the relation $t_2 = d/V_2$ holds for t_2, and the relation $\Delta t = t_1 - t_2 = d(1/V_1 - 1/V_2)$ for the difference in time, where the difference in time is expressed as the phase angle between the transmitted and the received signal by the relation $\Theta = 2\pi f \Delta t = 2\pi f d(1/V_1 - 1/V_2)$, where f denotes the oscillation frequency. The method used for measuring the phase shift is sensitive to small concentrations of the gas impurities. The device constructed consists of an oscillation transmitter and a receiver of acoustic oscillations made of piezoceramics, which are both located in a 5 cm^3 chamber. By means of an electron generator, a voltage having a frequency of 165 kcps is applied to the transmitter. The electric signal is transformed into elastic oscillations of the same frequency, which cause an electric signal on the surface of the receiver element; this

87706

An Acoustic Method of Gas Analysis S/032/60/026/012/011/036
B020/B056

signal is amplified and transmitted to an indicator. At a distance of $\lambda/2$ between transmitter and receiver, a standing wave is formed, whereby the maximum e.m.f. on the surface of the receiver is generated. By changing the composition of the gas mixture, the density of the gas medium and thus also the wave length is changed. This leads to a change in the signal phase, and to a decrease of the energy in the receiver. The scale may be calibrated in percents of the measured gas. The block diagram of the ultrasonic gas analyzer is shown in the figure. The electrical part of the device consists of semiconductor triodes П6Б (P6B) and is fed by the elements ОР-4 (OR-4). Several variants of this device are described. There is 1 figure.

AUTHORS: Anisimov, S. S., and Daragan-Sushchov, V. I.

TITLE: New Method of Determining Atmospheric Pollution With Dust

PERIODICAL: Gornyy zhurnal, 1960, No. 6, p. 74

TEXT: From 1957 - 1959, the Tsentral'naya nauchno-issledovatel'skaya laboratoriya (TsNIL) Gosgortekhnadzora (Central Scientific Research Laboratory (TsNIL) of the Gosgortekhnadzor) developed a dust counter which is based on the capability of the acoustic field of changing its parameters in dependence on the change of physical constants of the air investigated. An acoustic field is formed in the production of elastic vibrations by the respective sound or ultrasound vibrator in the direction of the analogous receiver in the gas medium investigated. If the distance between vibrator and receiver is equal to $\lambda/2$ (half wave) or its multiple, a "standing wave" is formed. This state is caused by the physical atmospheric state, the frequency of elastic vibrations, the distance between vibrator and receiver, and corresponds to the maximum energy output on the receiver

Card 1/3

88715

New Method of Determining Atmospheric Pollution With Dust

S/127/60/000/006/007/007
B012/B054

element. On the introduction of components changing the physical atmospheric state (especially dust), the parameters of the standing wave are redistributed, and less energy is put out on the receiver element. The degree of disturbance, and thus the change in emf on the receiver, can be expressed in mg/m^3 on the dial of the indicator. Such a device (produced at the TsNIL) comprises an electronic vibrator (generating vibrations of 5 - 6 kc/sec), an acoustic working chamber, an acoustic compensation chamber (to eliminate the effect of temperature changes) with transmitters, an electronic differential amplifier, an indicator, and a filter. The air-intake system is equipped with a rubber balloon. The electronic part of the device is composed of semiconductors. OP-4 (OR-4) mercury oxide elements are used as feeding source. The device weighs about 1.5 - 2 kg. Its sensitivity can be changed according to the frequency used and the distance chosen. The smallest amount of dust measurable is 10 - 20 mg/m^3. After appropriate reconstruction it would be possible to record the dust content continuously. Tests of the device in the dust plants of the Institut gigiyeny truda i profzabolevaniy AMN SSSR (Institute of Labor Hygiene and Professional Diseases of the Academy of Medical Sciences USSR) showed the

Card 2/3

The effect of various types ...

internal doses administered orally as a dibasic salt solution of P^{32} were 1.2, 1.88, and 3.8 μcuries/g, respectively. A combined irradiation was performed by administration of P^{32} immediately after external irradiation with half the dose. Catalase was determined manganometrically, and peroxidase with pyrogallol. The catalase activity in the blood decreased independently of the irradiation dose. Peroxidase turned out to be more resistant to irradiation, and its activity decreased only after a dose of 1200 rads. Internal irradiation affected the enzymes more severely than external irradiation. The determination of catalase activity together with examination of WBC may be of prognostic value if performed soon after irradiation as well as after the acute stage of radiation sickness. There are 4 figures.

TITLE: Improving the Technology of Casting Lift Truck Counterweight Wings (Usovershenstvovaniye tekhnologicheskogo protsessa otlivki kryl'yev protivovesa avtopogruzchika)

PERIODICAL: Liteynoye Proizvodstvo, 1958, Nr 6, pp 27-28 (USSR)

ABSTRACT: The article contains detailed information on a new way of molding 750 kg counterweight wings of lift trucks at the foundry of the L'vovskiy zavod avtopogruzchikov (L'vov Lift Truck Plant). The old molding method, consisting of molding in two mold boxes with the face side up (Fig. 1) was unsatisfactory. The new technology consists of using only one open mold box, with the face side of the casting turned downward (Fig. 2) and using earth-filled cast iron cores with core paint made of 0.7 liter of "4GR" binder and 1.0 liter of silver graphite. The cast iron cores have considerably improved the surface of the fitting portions of wings and brought about a considerable economy of molding materials and labor. There are 3 figures.
