Tsiley dokladov Soveshchaniya po vychislitel'noy matematike i primeneniyu
sredstv vychislitel'noy tekhniki (Outlines of Reports of the Conference On
Computational Mathematics and the Use of Computer Techniques) Baku, 1958.
65 p. 400 copies printed.

Additional Sponsoring Agencies: Akademiya nauk SSR. Vychislitel'nyy tsentr,
and Akademiya nauk SSSR. Institut avtomatiki i telemekhaniki.

No contributors mentioned.

PURPOSE: This book is intended for pure and applied mathematicians, scientists,
engineers and scientific workers, whose work involves computation and the use
of digital and analog electronic computers.

COVERAGE: This book contains summaries of reports made at the Conference on
Computational Mathematics and the Application of Computer Techniques.
The book is divided into two main parts. The first part is devoted to
computational mathematics and contains 19 summaries of reports. The second
section is devoted to computing techniques and contains 20 summaries of
reports. No personalities are mentioned. No references are given.

TITLE: Modeling of Tube Input Admittance (Modelirovaniye
vkhodnoy provodimosti lampy)

PERIODICAL: Radiotekhnika, 1958, Vol. 13, Nr 1, pp. 77-79 (USSR)

ABSTRACT: A diagram for the set up of a model of the effective component of the valve input admittance is given. The calculation of this diagram is given. It is shown that for such a model a dipole must be present the effective resistance of which changes with the square of the frequency. If this dipole besides the effective resistance also has a reactance the magnitude of the latter must be independent of the frequency. A diagram of such a dipole with a valve, in the cathode circuit of which a certain inductivity L. and between supply and cathode a capacity C is inserted is given. The dipole investigated here consists of a capacity and an effective resistance connected in series where the magnitude of the latter changes (proportionally) with the square of the frequency. For the experimental checking of the theoretical details an input effective admittance of the valve type

Card 1/2

Modeling of Tube Input Admittance

108-1-8/10

6 ~~X~~ 11 was modelled. As dipole valve a duotriode of the type 6H157 was used.

The experimental data confirmed the theoretical explanations.

AUTHOR: Gasanov, A. M.

TITLE: Adjustable filter for lower frequencies of the SHF-band.
Author's abstract

PERIODICAL: Radiotekhnika, v. 16, no. 2, 1961, 79-80

TEXT: The filter in question consists of a "conductor between two equipotential plates" type band transmission line and it has a variable characteristic wave impedance. The inner conductor diameter is constant within the filter which differs from standard SHF-filters. The variable characteristic wave impedance is obtained by changing the spacing between inner conductor and side plates, which makes the side plates to appear step-like (Fig. 1). The size of the L and C portion of the side plates vary. The filter is tuned by moving the inner conductor parallel to the plates. Since capacitance and inductance are changing linearly setting of the cutoff frequency is also linear. However, the characteristic wave impedance stays constant, since it is not a function of the inner conductor position. The inner conductor is sticking out over the front

Card 1/3

Adjustable filter for lower ...

89138

S/108/61/016/002/011/C11
B107/B212

end of the plates because their widths vary. This can be avoided by modifying the plates or the connecting device which is used to connect the filter with common coaxial line. This might be done as follows: 1) the plates are widened that the front end of the connecting device is vertical to the inner conductor. Here, the characteristic wave impedance of the extension brings about good tuning of the filter with both terminals. 2) The front end of the connecting device is slightly inclined to the inner conductor axis and the connecting device is located such that the inner conductor can be shortened where the side plates are also shorter. However, this is a very complicated method and it limits the change of the cutoff frequency. Experimental data as represented in Fig.3 show that the law for the change of cutoff frequencies with the configuration of the side plates is practically preserved. The filter can be calculated like that of a common coaxial line. The method of varying configuration of side plates and shifting of the inner conductor might also be applied for other purposes. There are 3 figures and 3 references: 2 Soviet-bloc and 1 non-Soviet-bloc.

Title : The Effect of Various Feedings of Carotene on
Succinodehydrase Activity in the Brain, Liver,
Kidneys and Skeletal Muscles.

Orig Pub: Sb. Tr. Azerb. med. in-ta, 1956, vyp. s, 26-30.

Abstract: Rats were fed daily, for a period of 10 days, 25-100 micrograms/kg of carotene, following which, succino-dehydrase activity was determined in various organs. Increase of enzyme activity was noted: 31.9% in the brain, 35.9% in the liver, 42.9% in the kidneys and 28.5% in the skeletal muscles. The highest effect was noted with daily feedings of 50 micrograms of carotene. -- V. I. Rozengart.

SOV/70-4-5-18/36

AUTHORS: Gasanov, B. G., Grum-Grzhimaylo, S. V.

TITLE: Absorption Spectra of the Crystals and Solutions
of the Complex Compounds of Fe, Ni, and Cu, with
Mono-, Di-, and Triethanolamine

PERIODICAL: Kristallografiya, 1959, Vol 4, Nr 5, pp 732-741
(USSR)

ABSTRACT: The protection of ferrous metals from corrosion by
the films of monoethanolamine or of its derivates,
their negative effect on nonferrous metals, the
preceding attempts to disclose the mechanism
leading to one or another effect, and determination of
the compounds formed by ethanolamines with various
metals, are cited. The authors studied absorption
spectra of the colored crystals and solutions of the
compounds listed in the title. The purpose was to
determine the valence and coordination of the complex-
ions, to clarify the effect of ethanolamines on the
absorption spectra and color of the complex compounds,

produced under various conditions. The absorption curves for solutions and crystalline powders of the ethanolamine compounds with Ni are shown in Fig. 2. The one year old crystals of $\left[\text{Cu}(\text{H}_2\text{NCH}_2\text{CH}_2\text{OH})_4\right]_{\text{SO}_4 \cdot 4\text{H}_2\text{O}}$, washed in water, had greenish-blue color, cleavages in 3 directions, extinctions from 0 to 30° , blue to green pleochroism, refraction indices $n_\gamma = 1.574$ and $n_\alpha = 1.560$. The $\left[\text{Cu}(\text{H}_2\text{NCH}_2\text{CH}_2\text{OH})_3\text{H}_2\text{O}\right]\text{SO}_4$ crystals, washed in alcohol, had blue color, and the same cleavages, extinctions, and pleochroism, as the former crystals, but lower hardness and refraction indices $n_\gamma = 1.571$ and $n_\alpha = 1.552$. The $\left[\text{Cu}(\text{H}_2\text{NCH}_2\text{CH}_2\text{OH})_4\right](\text{NO}_3)_2 \cdot \text{H}_2\text{O}$ crystals were dark blue, prismatic, with positive elongation and cleavages in 3 directions, violet to blue pleochroism, extinctions from 30° to 70° , $n_\gamma = 1.586$ and $n_\alpha = 1.581$. The $\left[\text{Cu}(\text{H}_2\text{NCH}_2\text{CH}_2\text{OH})_3\text{H}_2\text{O}\right](\text{NO}_3)_2$ crystals had about the same properties. Similarly, the properties of the complex compounds with Ni and Fe were

established. They differ considerably from the former, including the crystal habits. The compounds with Fe proved to be unstable except in alcohol. The reactions with pure Ni and Cu produce the same compounds, which result from reactions with the salts of the respective metals. The maximum absorption shifts toward longer waves when monoethanolamine is substituted by di- and triethanolamines, while substitution of SO_4 by NO_3

hardly affects the absorption. There are 3 figures; 2 tables; and 19 references, 13 Soviet, 2 French, 1 U.S., 1 German, 1 Finnish, 1 Indian. The U.S. reference is: M. Bolling, L. Hall, J. Amer. Chem. Soc., 75, 16, 3953 (1953).

TITLE: Effect of ethanolamines on some nonferrous and ferrous metals

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 10, 1961, p. 260, abstract 10M238 (10T238). ("Uch. zap. Mosk. gos. ped. in-ta im. V.I. Lenina", no. 146, 1960, 170-175) (MIRA 15:4)

TEKT: It is stated that ethanolamine used as corrosion innibitor for ferrous metals attacks nonferrous metals (Cu,Co) by forming with them complexes of the following type: $[\text{Cu}(\text{H}_2\text{NCH}_2\text{CH}_2\text{OH})_4] \text{CO}_5 \cdot 5\text{H}_2\text{O}$. With ethanolamine in the presence of atmospheric oxygen, Fe produces a compound of the following composition: $[\text{Fe}(\text{H}_2\text{NCH}_2\text{CH}_2\text{OH})_3] (\text{OH})_3$ which is only stable in the absence of humidity. TITLE: Changes in the electrode potentials of iron, cobalt, nickel, and copper in monoethanolamine in the presence of some oxidizers

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 1, 1962, 86, abstract 1160⁴
("Tr. In-ta khimii, AN AzerbSSR," 1961, v. 19, 97-106, Azerb.
summary)

TEXT: When studying changes in electrode potentials of 20 grade steel, Co, Ni and Cu in monoethanolamine solutions (I) in the presence of oxidizers (O_2 , H_2O_2 , $K_2Cr_2O_7$) the following facts were established by the potentiometric method: I is not oxidized by the action of H_2O_2 and O_2 . The effect of I on the metals results in the summary effect of the inhibitor and H_2O_2 , which entails abrupt changes in the potential to the positive side. The diffusion of these metals in I, in the presence of H_2O_2 , is practically not different from the diffusion of these metals in the presence of O_2 . Changes in the potential when $K_2Cr_2O_7$ is added to I, can be explained by the fact, that I due to its alkaline properties converts the $Cr_2O_7^{2-}$ ion into a CrO_4^{2-} ion, forming on the metal

TITLE: Infrared absorption spectra of selenogallates MeGaSe_3 of certain lanthanides

SOURCE: Azerbaydzhanskij khimicheskiy zhurnal, no. 5 , 1965, 82-85

TOPIC TAGS: selenium compound, gallium compound, lanthanum compound, praseodymium compound, neodymium compound, samarium compound, cerium compound, infrared spectrum, refractive index, x ray diffraction

ABSTRACT: An attempt was made to establish general relationships between the optical properties and composition of the compounds LaGaSe_3 , CeGaSe_3 , PrGaSe_3 , NdGaSe_3 , and SmGaSe_3 . An IKS-14 infrared spectrograph and MIN-8 polarizing microscope were used. All the IR absorption spectra of these compounds were found to be basically similar, and not very different from the IR spectra of the corresponding selenides. This shows that the selenogallates studied are analogous in character. These results are in agreement with the reported results of thermographic, x-ray diffraction, and chemical analyses. Microscopic examination showed the selenogallates to be nontransparent, i. e., no pleochroism or extinction was observed. The refractive indices of the compounds were measured and found to be the same,

Alkylation of polynuclear aromatic hydrocarbons with
unsaturated hydrocarbons? V. G. Sharandaev and D. G.

Gasanov. M. Koms. 1936, No. 1, p. 21 (Russian summary)
21-2 - Catalytic alkylation of anthracene with unsatd
hydrocarbons, contained in cracked gasolines. In the presence
of H_2SO_4 leads to the formation of tri-, di-, and monoalkyl
derivs. With increase of mol. wt. of olefin the formation of
di- and tri-alkyl derivs. becomes more difficult. The opti-
mum yield of the monoderivs. was obtained at 0-10°,
90-2% H_2SO_4 , conc., and at the ratio of olefins to anthra-
cene 4-10:1, time 3-4 hrs. The compds. obtained corre-
spond to the amyl, hexyl, heptyl, octyl, nonyl, undecyl an-
thracenes with b.p. from -10 to -37°. They are charac-
terized by high viscosity and can be used as synthetic oils.

TITLE: Spectrophotometric study and development of a method of determining the germanium-stilbazo complex

SOURCE: Azerbaydzhanskiy khimicheskiy zhurnal, no. 3, 1965, 120-126

TOPIC TAGS: germanium, germanium compound, quantitative analysis, spectrophotometric analysis

ABSTRACT. The authors observed that germanium reacts with stilbazo to form an orange-colored complex. In order to determine the conditions of complex formation, absorption spectra of the reagent and complex were taken at various pH values, and the molar extinction coefficient (at 5300 Å) and instability constant of the complex were determined. The composition of the complex was found to be $[Ge^{+4}]:[R] = 1:2$. The solution of the complex obeys the Lambert-Beer law. A method is proposed for determining germanium in the absence of foreign ions when the metal is present in amounts from 4 to 73 $\mu g/ml$. The method is applicable to the determination of germanium-containing samples. A comparison with the gravimetric and colorimetric (phenylfluorone) methods shows that the proposed method is just as accurate. Orig. art. has 7 figures and 3 tables.

TITLE: Investigation and photometric determination of a complex compound of germanium
with Alizarin Red S

SOURCE: Azerbaydzhanskiy khimicheskiy zhurnal, no. 4, 1965, 92-95

TOPIC TAGS: photometric analysis, optic method, germanium, optic density, optic property, complex molecule, germanium compound

ABSTRACT: The feasibility of photometric determination of germanium contents was examined. The object of the study was to develop a simple optical technique for analytical purposes. Various mixtures of $1 \cdot 10^{-3}$ moles of Alizarin Red S in water with metallic germanium in H_2O_2 were prepared and examined on an FM-photometer. The volume of solution V was 25 ml, the $\lambda = 4700 \text{ \AA}$, and the cuvette length $l = 1 \text{ cm}$. The position of the maximum of the optical density (see fig. 1) indicates that the ratio of Ge^{+4} to Alizarin Red S in the complex compound is 1:2. The results of the photometric method based on the Ge-Alizarin Red S complex were in good agreement with the results of the gravimetric method as well as with the phenylfluoric- and molybdenum methods.

AUTHORS: Gasanov, E. M.; Prokhorov, A. M.; Fedorov, V. B.

TITLE: Paramagnetic relaxation in systems with strong exchange interaction at low temperatures

SOURCE: Fizika tverdogo teln, v. 6, no. 1, 1964, 193-199

TOPIC TAGS: paramagnetic relaxation, exchange interaction, low temperature, Alpha diphenyl Beta picrylhydrazine, magnetic ordering, absorption line, integral intensity, Zeeman subsystem, exchange subsystem

NOTATION: In experiments on electron paramagnetic resonance in the free organic radical λ,λ -diphenyl- β -picrylhydrazine at 42 Mc the authors observed, along with an increase in absorption line width, an increase in relaxation time between Zeeman and exchange subsystems when the temperature was reduced from 77 to 1.5K. According to theory and some experiments, at extremely cold temperatures the relaxation time should become shorter when the width of the line is increased. The discrepancy between experiment and theory is apparently due to the difference between properties of the spin systems in the organic crystal studied and those of a

Card 1/2

ACCESSION NR: AP4011756

purely paramagnetic system. This difference appears in local magnetic ordering of spins at low temperatures, which is associated with increases in the value $I/kT \rightarrow 1$ but which is not substantial in experiments at frequencies on the order of 10,000 Mc with a large external magnetic field. This local ordering is indicated by a decrease in the integral intensity of the absorption line at temperatures of about 2.0K. Near magnetic ordering indicates the introduction of a correlation between the exchange interaction of various spin pairs, and, consequently, diminishes (for constant intensity) characterizing an exchange constriction of the absorption line. An increase in relaxation time means an increase in the characteristic frequency of the exchange subsystem in which the relaxation process occurs; given magnetic ordering, which changes the energy spectrum of the exchange system, this increase in frequency may be considered probable. Orig. art. has: 2 figures and 15 formulas.
