Title : On the Question of Experimental Investigation of the Rotational Depolarization of Fluorescence of Solutions  
Orig Pub : Acta phys. et chem. Szeged., 1958, 4, No 3-4, 90-93  
Abstract : An experimental verification was made of the Levshin-Perrin formula, which relates the degree of polarization of fluorescence  $p$ , the absolute temperature  $T$ , the viscosity of the solution  $\eta$ , the duration of the excited state  $\tau$ , and the volume  $v$  of the dye molecule. Glycerine-water solutions (0.0 -- 94.4% glycerine by volume) of fluorescein ( $10^{-4}$  mole/liter) were investigated. It was established that in a wide

Title : A Note on the Luminescent Analysis of Bitumens

Orig Pub : Acta phys. et chem. Szeged., 1958, 4, No 3-4, 94-96

Abstract : The bituminosity of surface layers of the soil has a double origin: 1) the bitumens could be formed from the organic substances contained in the soil, 2) they could rise to the surface layer of the soil from the deeper petroleum-bearing layers. To clarify the origin of the bituminosity of the soil, a method is proposed of measuring the polarization of the luminescence of the bitumens contained in this soil. From an area of 60 squares

Card 1/2

Abs Jour : Ref Zhur Fizika, No 11, 1959, 26301

kilometers, more than 250 samples of soil were taken from a two-meter depth. The bitumens contained in the samples were extracted with benzene. It was observed that the luminescence of the bitumens from petroleum-bearing sections is unpolarized, while the degree of polarization of the luminescence of bitumens in non-petroleum-bearing portions reaches 3 to 5%. The absence of polarization of luminescence of bitumens from petroleum-bearing sections is related to the higher symmetry of their molecules. The method of measurements of polarization of bitumens may be useful in searching for oil deposits.

Med. Effect of adrenalectomy on the adenosinetriphosphatase activity of the organs of the rat. P. Kertal, T. Gati, I. Fehér, Gy. Harmos, and F. Kocsis (Univ. Med. School, Budapest). *Acta Physiol. Acad. Sci. Hung.* 9, 285-6 (1956) (in English).—In rats killed 7 days after bilateral adrenalectomy the adenosinetriphosphatase (ATPase) was significantly decreased in muscle, liver, kidney, and intestinal mucosa. The ATPase activity of muscle and liver of bilaterally adrenalectomized rats given cortisone for 7 days was normal. C. Riegel

GATI, 1.

The role of the adenosine triphosphate content of the intestinal mucosa in the absorption of glucose. I. Fodor, P. Kertai, and T. Gell (Univ. Med. School, Budapest). *Acta Physiol. Acad. Sci. Hung. 10: 19-22 (1953)* (in English).

—Perfusion, by means of cannulas tied into the duodenum and terminal end of the ileum in rats, with 0.5% NaCl was followed by 1 ml. of 5.4% glucose soln. or water soln. After 1/2 hr. the intestine was again perfused with NaCl soln. The difference between the quantity of glucose introduced and that washed out was taken as the quantity absorbed. The adenosine triphosphate (ATP) content of the intestinal epithelium, as determined by the method of Lohmann (*C.A.* 22, 2687), was 140 mg. per 100 g. of intestine or about 6.6% of the dry wt. The ATP content of the duodeno-jejunal section was 26% higher than in a comparable section of the ileum. The subcutaneous application of 12 mg./100 g. of indocetic acid (IAA), intravenous injection of 3 mg./100 g. of NaF, or the intraperitoneal injection of 2.5 mg./100 g. of 2,4-(O,N)-D,6,9-OH (DNP) had little effect on the ATP content of the resting intestinal epithelium, but the simultaneous injection of NaF and DNP reduced the ATP content. During glucose absorption following treatment with IAA, NaF, or DNP, the ATP content was 60, 60, and 70 mg./100 g., resp. The IAA reduced the alk. phosphatase activity, but DNP, NaF, and DNP + NaF were without effect. For these animals glucose absorption was proportional to phosphatase activity. When NaF was given, followed 30 min. later by glucose, the glucose was absorbed normally but the ATP content dropped to half the original value. In a test 30 min. later the sugar absorption was reduced (55 mg./100 g.) and the ATP content was further reduced (52 mg./100 g.) but the phosphatase activity was normal. The addn. of ATP did not increase the absorption of glucose. The absorption of glucose requires both normal phosphatase activity and normal ATP levels.

E. L. Fodor

GATI, T.

The role of the adenosinetriphosphate content of the intestinal mucosa in the absorption of various substances. P. Kertai, I. Fehér, and T. Gáti (Univ. Med. School, Budapest). *Acta Physiol. Acad. Sci. Hung.* 10, 33-41 (1938) (in English); cf. preceding abstr.—In animals treated with iodoacetic acid (IAA) previous to the injection of 5 g. of Bu stearate or 5 ml. of 2.5% glycine, 4.5% xylase, 0.35% NaCl, or 1.5% urea soln. the adenosinetriphosphate (ATP) content of the intestinal epithelium dropped from 103 mg. % for the control to 61, 46, 49, and 53, resp. When 10 ml. of air was injected instead of 5 ml. of fluid, the ATP content was 107. Thirty min. after the absorption of NaCl or urea by animals treated with NaF, glucose absorption was 66 and 62 mg., resp., compared with 123 mg. for the control. The absorption of urea in the control at 15 and 30 min. was 27.1 and 0.6/mg., resp., while in the IAA-treated animals it was 31.2 and 35.8 mg., resp. The absorption from 2.7, 5.4, and 8.1% solns. in IAA-treated animals after 30 min. was 40, 33, and 120 mg., resp., and the ATP content was 108, 66, and 44 mg. %. Similarly the absorption from 0.5, 1.5, and 3.0% urea solns. for the IAA-treated animals was 11.6, 35.8, and 53 mg., resp., and the ATP content 94, 53, and 35 mg. %, resp. In the controls the urea absorbed was 13.4, 65.1, and 134 mg., resp., and the ATP content was 108, 107, and 168 mg. %, resp.

The influence of rations deficient in methionine and lysine on conditioned reflex activity in white rats. P. Weisz, J.

5

Ref

Sós, T. Gati, G. Karmos, and J. Rigó (Inst. Pathol. Physiol., Univ. Budapest, Hungary). *Voprosy Pitanija* 15, No. 1, 13-21(1956).—Results are presented which indicate that not only protein-deficient rations, but also the rations deficient in methionine and lysine, cause serious disturbances in the higher nervous system; the deficiency of lysine affects in the first place the normal excitability of the cerebrum. Histological abnormalities have been found in the tissues of liver, pancreas, and kidneys following the feeding of methionine- and lysine-deficient diets. After 5 weeks feeding of a full-nutrient diet to the exptl. animals the conditioned reflex activity was not entirely restored, while the body wt. and the functioning of the internal organs became normal again. 313. EFFECT OF TRYPTOPHAN DEFICIENCY ON EXPERIMENTAL NEUROGENIC AND RENAL HYPERTONIA - Wirkung des Tryptophanmangels auf die experimentelle neurogene und renale Hypertonie bei Ratten - *GATI T.*, Sós J. and Hidég J. Pathophysiol. Inst., Med. Univ., Budapest - ACTA PHYSIOL. ACAD. SCI. HUNG. 1958, 13/4 (375-379) Graphs 3

Previous experiments by the authors had demonstrated that rats on a methionine-free diet, react with a higher blood pressure on certain specified exogenous stimuli than do normally fed rats. In this paper the same reaction was studied in rats on a tryptophan-free diet. Tryptophan was chosen since in its metabolic elaboration vaso-active products, e.g. serotonin developed. It was found that in rats on a tryptophan-free diet, the hypertension (following exogenous stimuli with electric currents, light and sound) reached higher levels and was sustained for longer periods than in rats on a normal diet, i.e., sensibilization of the tryptophan-free rats occurred. The effect was also more marked than in rats on a methionine-free diet. In non-stimulated rats tryptophan deficiency produced a moderate and reversible decrease in blood pressure. In renal hypertension tryptophan deficiency lowered the blood pressure, while exogenous stimuli failed to produce sensibilization.

4839. RESERPINE AND INTESTINAL MICROMOTILITY - Reserpin és a bél mikromotilitása - Gáti T., Hideg H. and Ludány G. Orvostud. Egyet. Körélettani Int. Közl., Budapest - ORV. HETIL. 1958, 99/47 (1641-1643) Graphs 5

Reserpine (1 mg./kg. i. v.) causes an increase in motility of the villi of the intestine in situ (chloralosed dog). The effect appears promptly and lasts 80 min. or longer. It is not prevented by bilateral thoracic vagotomy. After pyloric ligation the effect is shorter (30 min.). It is abolished by atropine and by hexamethonium following pyloric ligation. The enhancement of automatic activity of the villi is ascribed to an initial stimulatory action of reserpine on the peripheral ganglia, followed by a humoral effect of longer duration, the latter being due to increased gastric secretion and consequently greater acidification of the duodenal contents.

402. EFFECT OF CHLORPROMAZINE ON INTESTINAL ABSORPTION OF SUGARS - Wirkung von Chlorpromazin auf die Zuckerresorption aus dem Darm - Gáti T., Harmos G. and Ludány G. Patho-Physiol. Inst., Univ. Budapest - ARCH. INT. PHARMACODYN. 1958, 114/3-4 (251-257) Tables 4

Glucose absorption from the intestine in situ was reduced by an average amount of 22.7% by chlorpromazine (15-20 mg./kg. to rats). The drug has an inhibitory action on motility of the villi and on enzyme action. Alkaline phosphatase activity of the intestinal mucosa did not appear to be affected, but ATPase activity was reduced by an average of 29%. Meyer-Oulif - Paris

"Formation of Renal Pressor Substance in Animals on Amino  
Acid Deficient Diet."

Budapest, Kísérletes Orvostudomány, Vol 14, No 5, Oct 62,  
pp 520-522.

Abstract: [Authors' Hungarian summary] Significantly lower  
quantities of renin could be extracted from the kidneys of  
rats kept on methionine or tryptophan deficient diets and  
at the same time the number of juxtaglomerular complexes  
decreased as demonstrated by histological methods. Since the  
latter is considered to be the anatomical substrate of renin,  
the results of the biological titration and the histological  
study are in harmony. It is possible that this phenomenon is  
related to the hypotension of rats on amino acid deficient  
diets and also to the fact that in such a state hypertoni-  
city cannot develop either acutely or chronically. [16 ref's,

"The Influence of Duodenal Osmoregulation on Cardiac Activity and Blood Pressure"

Budapest, Acta Physiologica Academiae Scientiarum Hungaricae, Supplement to Vol 22, 1963; pp 10-11.

Abstract [Authors' English summary]: The intraduodenal injection of hyper- and hypotonic solutions lowers the mean arterial blood pressure. The pressor reflex evoked by clamping the two common carotids, as well as the hypertensive response to stimulation of the splanchnic nerve are also significantly diminished. Meanwhile, the heart rate increases, and in the ECG depressed R waves, and in leads 2 and 3 elevated P waves occur. The phenomenon persists for more than 1 hour. It is thought to be caused by inhibitory impulses from the osmoreceptors of the duodenal mucosa reaching the vasomotor center via the vagus, lowering its tone. This view is supported by the observation that bilateral cervical vagotomy abolishes the above phenomenon. The humoral nature of the effect

"Effect of Cardiopathogenic Diet on the Thiopental Anesthesia"

Budapest, Acta Physiologica Academiae Scientiarum Hungaricae, Supplement to Vol 22, 1963; p 16.

Abstract [Authors' English summary, modified]: In rat experiments with sleep induced with thiopental it was found that thiopental anesthesia is contraindicated by nutritional disturbances of the heart muscle.

"Hypertension in Rats Caused by Lithium."

Budapest, Kisasszietes Orvostudomány, Vol 15, No 1, Feb 65, pp 53-57.

Abstract: [Authors' Hungarian summary omitted] Intraperitoneally administered lithium chloride led to hypertension in rats within six weeks. The onset was dependent on the dosage. Independent of the dosage, enlargement of the heart and of the adrenals but not of the kidneys was observed. Histologically, slight parenchymal degeneration was seen in the kidney, lipids disappeared from all three layers of the adrenal, but there was no change in the heart. The hypertension, similar to that caused by sodium chloride, is ascribed to a disturbance of the extracellular space and the electrolyte content of the extracellular fluid. Of 20 references, one is Hungarian, the rest is Western.

"Effect of Cardiopathogenic Diet on the Pentothal Sleeping Time of Rats."

Budapest. Honyodórvos, Vol 15, No 1, Jan-Mar 63, pp 55-61.

Abstract: [Authors' Hungarian summary modified] Rats kept on a cardio-  
pathogenic diet became hypertonic while rats kept on semi-starvation  
rations became somewhat hypotonic. The pentothal sleeping time of both  
groups increased continuously during the six-week long experiment, fas-  
ter in the case of those on the cardiopathogenic diet. The ether sleep-  
ing time was essentially unchanged. The experiments support those data  
obtained so far which suggest that in the case of nutritional disturbance  
of the heart muscle pentothal narcosis is contraindicated. Of 21 refe-  
rences, 3 are Eastern European, the rest is Western.

TITLE: Effect of hyperoxia on gastric hydrochloric acid secretion in the rat  
[This paper was presented at the 29th Meeting of the Hungarian Physiological  
Society held in Szeged from 2 to 4 July 1964]

SOURCE: Academia scientiarum hungaricae. Acta physiologica, v. 26, Supplement,  
1965, 26

TOPIC TAGS: rat, hyperoxia, biologic secretion, hydrochloric acid, digestive  
system, digestive system disease

ABSTRACT: It has been reported in earlier papers that the development of the SHAY ulcer is completely inhibited by hypoxia and strongly promoted by the inhalation of pure oxygen. In this intensive ulcerogenic action of hyperoxia, an important role was attributed

Card 1/2

L 14866-66  
ACC NR: AT6007405

to the increase in gastric secretion caused by oxygen. Male albino rats weighing 180-220 g were used in the present experiments. The animals were starved for 48 hours, were given water ad libitum, and underwent SHAY's operation under ether anesthesia. Following surgery, the rats were divided into three groups. The first group was exposed to a stream of pure oxygen at 260 mm Hg pressure for 6 hours, the second group to pure oxygen at 310 mm Hg pressure for 6 hours, the third group served as control. After 6 hours, the animals were exsanguinated and were examined as to the volume, free HCl content and total acidity of the gastric juice. According to the results obtained, hyperoxia caused a definite increase in the HCl secretion of the stomach. [JPRS]

TITLE: Humoral regulation of saliva secretion in the rat [This paper was presented at the 29th Meeting of the Hungarian Physiological Society held in Szeged from 2 to 4 July, 1964]

SOURCE: Academia scientiarum hungaricae. Acta physiologica, v. 26, Supplement, 1965, 25-26

TOPIC TAGS: rat, drug effect, biologic secretion, digestive system, digestion, animal physiology

ABSTRACT:

The conditioned and unconditioned reflex control of salivation is well known. BEZNAK was the first to show that salivation increases in response to humoral effects. No data are available, however, related to an inhibitory mechanism. Such a mechanism might be expected to come into action when the food leaves the stomach and enters the duodenum. Several parahormones are liberated from the intestinal mu-

Card 1/2

L 14892-66

ACC NR: AT6007404

cosa upon entry of the food into the duodenum. Of these, gastric secretion is markedly reduced by enterogastrone. It has been shown that olive oil administered into the duodenum, suppresses the pilocarpine-induced salivation strongly while it has no influence on the sialic acid, Na and K concentration of the saliva. It may be surmised that the duodenal parahormones activated by the oil are responsible for the effect. [JPRS]

TITLE: Role of serotonin in experimental dumping syndrome /This paper was presented at the 29th Meeting of the Hungarian Physiological Society held in Szeged from 2 to 4 July 1964/

SOURCE: Academia scientiarum hungaricae. Acta physiologica, v. 26, Supplement, 1965, 45

TOPIC TAGS: serotonin, blood pressure, dye chemical, digestive system, dog, chlorinated aromatic compound, drug effect, pharmacology, animal physiology

ABSTRACT:

It was shown earlier in dogs that the intravenous infusion of serotonin influenced the regulation of blood pressure in a manner which can be observed in the experimental dumping syndrome. The azo dyes administered intravenously stain the enterochromaffin cells of the intestinal mucosa. The combining of the dye and serotonin

Card 1/2

1 15486-66

ACC NR: AT6007440

can also take place in vitro. Following the intravenous administration of 5-chloro-o-toluidine, the dumping syndrome can not be induced by the intraduodenal infusion of a hypertonic solution or oil. This observation lends support to the view that serotonin plays a role in the dumping syndrome.

"Inhibition of the Effect of Serotonin (5-HT) in Isolated Organs, By Means of Diazo Compounds"

Budapest, Kiserletes Orvostudomány, Vol 18, No 6, 1966; pp 604-607.

Abstract: By means of diazonium salts containing no stabilizing agent the effect of serotonin was eliminated in isolated stomach-fundus preparation and uterus of rats. The inhibition is based on the transformation of 5-HT into an azo dye. On the basis of their specificity and reversibility observed under the experimental conditions, the diazonium salts may be used for antagonizing the effect of 5-HT in the titration of the acetylcholine- and oxytocin content of experimental material which also contains 5-HT. ? "Rules of Velocity and Energy Variation of Wind in Belorussian SSR Conditions" Izv. AN Bel SS<sup>U</sup>, No 6, 1954, 69-82

Statistical analysis of observations made over many years at various meteorological stations of Belorussia yielded rules governing velocity and energy of wind and improved computational accuracy of wind electric stations. Annual behavior of wind velocity variation in Belorussia exhibited a sinusoidal character. The conditions of recurrent wind velocities prevailing in Belorussia are best represented by Gullen's theoretical curve. Divergencies between theoretical and experimental data are ascribed to inaccurate observation methods.

TITLE: Power Calculation Methods for Parallel Operation of Wind-Electric and  
Hydroelectric Stations (Metodika energeticheskikh raschetov parallel'noy  
raboty vetroelektricheskikh i gidroelektricheskikh stantsiy)

PERIODICAL: Tr. in-ta energetiki AS BelSSR, 1955, Nr 2, pp 21-75

ABSTRACT: Parallel operation of windmill electric generating plants and regulated hydroelectric plants in a local power system, which uses a water reservoir as an energy storage device intended to cover dips in the output curve of the windmill plant, is one of the most efficient methods of operating the windmill plants. Problems of selecting reservoir parameters needed to suit the wind conditions are considered, as well as the methods of energy calculations of parallel operation of windmill and hydro plants. The methods of finding the relationship between the windmill-plant output and its installed capacity, or

Card 1/4

SOV/112-57-5-10002

Power Calculation Methods for Parallel Operation of Wind-Electric and Hydro- . . . .

between the same output and the wind-electric coefficient  $X_N^b = \frac{N_{ust}^b}{P_{maks. sist.}}$  ,

require a comparison between the system daily loads and the windmill-plant output over 6-hour periods for 4 characteristic seasons; this is accomplished by means of integral load-duration curves and wind-velocity repetition curves plotted for the above periods. For wind conditions prevailing in BelSSR and for a D-30 windmill plant, with  $X_N^b = 0.1$ , the windmill-plant output in relative

units will be equal  $\lambda = \frac{E_c}{E_{potents}} = 1-0.83$ . Required annual-regulation

capacity is calculated on the basis of the average monthly powers determined from the integral output curves. Adding a wind-electric generating plant to a power system does not require increased water-reservoir capacity of the hydrostation since the average monthly power of the windmill plant and the

Card 2/4

SOV/112-57-5-10002

Power Calculation Methods for Parallel Operation of Wind-Electric and Hydro- . . . .

power-system load vary almost synchronously, and the utilization of the hydro-electric plant does not decrease. The necessary capacity of annual-regulation water reservoir constitutes 0.15-0.3 of the annual energy consumption in the system. Abridged integral curves of windmill-plant output are used to determine the required capacities of monthly storage. Monthly-regulation capacities corresponding to the windmill-plant output (about 12% of the hydroelectric-station output) have been found to be  $W_{mes} = (0.0006 - 0.012) E_{god}^g$ ; they compare with the daily-regulation capacity. On the basis of a great number of observations of wind velocities at several meteorological stations, empirical curves of firm monthly windmill-plant outputs in various seasons were obtained. The abridged integral curves also serve to determine the windmill-plant output losses corresponding to various capacity values. As a result, the curves of utilization of relative annual and monthly outputs of the windmill

plant  $\gamma = \frac{E_{isp}}{E_0}$  were obtained; the curves are plotted as a function of the

Card 3/4

SOV/112-57-5-10002

Power Calculation Methods for Parallel Operation of Wind-Electric and Hydro- . . . .

capacity  $W$  expressed as a fraction of the annual output  $E_0$ . For various capacity values  $W = 0-0.03$ , the utilization of the annual output can amount to  $\delta = 0.58-0.95$ . In calculating the sureness of the monthly output, the capacities necessary to cover all calm periods of a given month are determined. To ensure  $p = 75-95\%$  coverage of the load, the capacity  $W = 0.04-0.02$  is necessary, with  $p = 50\%$ , the capacity will be  $W = 0.05$ . The firm additional capacity of the hydroelectric station required for parallel operation with the windmill plant can be determined from the winter curve of the firm monthly output of the windmill with an assuredness of 80-95%; the duplicating share of the power can be found from the same curve on the basis of the daily output difference with an assuredness of 50-80%. The optimum windmill capacity used jointly with the hydroelectric station capacity can be determined by alternate-project calculations; the windmill-plant operation becomes economical at  $X_n^b < 0.6$ .

TITLE: Synthesis and properties of certain new sulfides of tertiary arsines

SOURCE: Zhurnal obshchey khimii, v. 36, no. 1, 1966, 55-57

TOPIC TAGS: sulfide, chemical synthesis, biochemistry, fungus, fungicide, skin disease, animal disease, dermatology

ABSTRACT: New sulfides of the series of ethyl-n-alkylphenylarsine and ethyl-n-alkyl-p-tolylarsino, as well as ethyl-allyl-phenylarsine sulfide and ethyldiallylarsine sulfide were synthesized by the reaction of tertiary arsines with sulfur, and their properties were studied. Biological tests indicated that the sulfides of the ethyl-n-alkylphenylarsine series exhibit fungicidal properties with respect to the fungi (*Trichophyton gypseum*, *Epidermophyton*) that cause human and animal dermatomycoses. A substantial improvement of the fungicidal properties were noted in the series from the lower to the higher homologs. A later communication will discuss the variation of the fungicidal properties of other arsenic sulfides as a function of the substituent radicals. Orig. art. has: 2 tables. [JPRS: 35,998]

TITLE: Rearrangement of some dialkylarylsarsine sulfides into the corresponding  
alkyl alkylarylsarsines

SOURCE: Zhurnal obshchey khimii, v. 36, no. 9, 1966, 1670-1672

TOPIC TAGS: fungicide, dialkylarylsarsine sulfide, alkylalkylaryl, alkylmercaptosarsine,  
sulfide, mercaptan, phenyl compound

ABSTRACT: To obtain new fungicides, rearrangement of some dialkylarylsarsine  
sulfides  $\text{Alk}_2(\text{Ar})\text{As}\rightarrow\text{S}$  was studied. Diethylphenylarsine sulfide  
on heating in a sealed tube for 7 hr at  $240^\circ\text{C}$  undergoes re-  
arrangement:

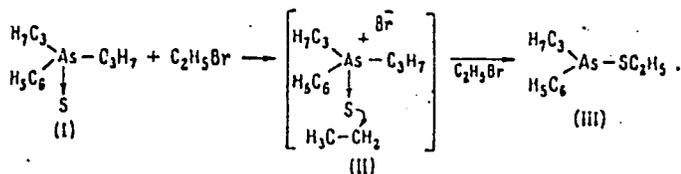

Card 1/2

ACC NR: AP6031389

The same reaction takes place in vacuo at 200°C. The rearrangement of dipropylphenylarsonium sulfide (I) in the presence of ethyl bromide in a sealed tube at 100°C proceeds by the following mechanism:

In the presence of propyl bromide, I underwent rearrangement similar to that in the presence of ethyl bromide to form the corresponding thioarsine. [WA-50; CBE No. 12]
