

GAVRILENKO, G. I.

"Measurement of the Torque of an Engine and Determination of Rational Regimes of Operation of an Automobile"

Tr. Gor'kovsk. Politekh. In-ta, ~~МЕХАНИКА И МАШИНОСТРОЕНИЕ~~ Vol 7, No 2, 1954, 10-38

The author describes an instrument which makes it possible to record torque on a Cardan shaft, fuel expenditure, magnitude of the opening of the baffle plate of the carburetor and time of motion on one tape under actual road conditions. He considers the question of the accuracy of the measurement of torque. He cites experimental data and shows by a calculation how to determine the proper speed for minimum cost and maximum fuel economy. (RZhMekh, No 7, 1955)

AUTHOR: Gavrilenko, I.S.

TITLE: Acetylcholinesterase activity and the histopathology of lymphadenoid tissue in severe radiation sickness

PERIODICAL: Radiobiologiya, v. 1, no. 6, 1961, 861 - 865

TEXT: Experiments were made with 55 adult cats, 10 used as a control, to determine acetylcholinesterase activity in lymphadenoid tissue and the initiation and development of histopathological processes following a single exposure to X-rays at a dose of 700 r using a P/M-3 apparatus (RUM-3 mass X-ray unit 3) with an atmospheric rate of 23.5 r/min. Reduction in weight and leukopenia were the criteria for the severity of the sickness. Leukocytes fell from 10,000 - 12,000 to 800 - 500/mm³ blood. Death usually ensued on the 13 - 15th day, and was due to exsanguination in the 1 - 15th day after exposure. Palatine tonsils, the mesenteric ganglion, and spleen were studied. Acetylcholinesterase activity was studied by a histochemical method described by Koelle and Friedenwald (Ref. 9: X

Card 1/3

32748

Acetylcholinesterase activity and ...

S/205/61/001/006/008/022
D268/D305

Proc. Soc. Exptl. Biol. and Med., 70, 4, 617, 1949). In the 3 -4th day after irradiation there was increased acetylcholinesterase activity in tonsil, mesenteric ganglion and spleen tissue in the form of more intense staining of the follicle cell elements of the first two and of the Malpighian bodies of the spleen; it was intense in red pulp reticular stroma cell elements at this time. During the 10 - 14th day specific cholinesterase activity in these tissues fell sharply, which confirmed the author's previous results (Ref. 10: Tez. dokl. na V. Vsesoyuzn. s'yezde otolaringologov SSSR (The- ses of Papers Presented at the 5th All-Union Conference of Otolaryngologists of the USSR) 185, Medgiz, 1958). The increase in acetylcholinesterase activity in the first days after irradiation is attributed to the production by the organism of a large number of small cell elements with a large specific cholinesterase content; these perish during the 12 - 14th day resulting in a reduction of the enzyme activity. This was further partially confirmed by studying histological preparations at the same periods of increased and reduced acetylcholinesterase activity. At the 3-4th day the size of follicles and Malpighian bodies decreased, while at the 13-14th

cay lymphadenoid tissue disappeared almost completely as well as most of the follicles and Malpighian bodies, and the splenn capsule thickened. Results showed that there is a considerable inhibition of specific cholinesterase i.e. acetylcholinesterase activity in the lymphadenoid tissue in radiation sickness, showing the importance of the cholinergic systems in radiation sickness pathogenesis. There are 2 figures and 11 references: 6 Soviet-bloc and 5 non-Soviet-bloc. The references to the English-language publications read as follows: G. Koelle and J. Friedenwald, Proc. Soc. Exptl. Biol. and Med., 70, 4, 617, 1949; J.G. Doull, Pharmacol. and Exptl. Therap., 110, 14, 1954; J. Sabine, Amer. J. Physiol., 187, 2, 275, 1956. X

Extracting grape seed. I. Gavrilenko. *Masloboina Zhirovo Delo* 15, No. 3, 3-5 (1930).—Grape seed can be successfully extd. with gasoline in a battery of extractors. For best quality and yield of oil the seed must be clean (it can be freed from skins and dirt in a Saturnia machine) and should be dried to 8-9% moisture while fresh, before mold growth can set in. The yield of oil from 100 tons grape seed was 10.87 tons; unavoidable loss of oil, 0.12 ton. The I no. of the oil was 132.8, indicating the possibility of use as a drying oil in paint manuf. The extr. residue may be used in stock feed or in making coffee substitutes.

TITLE: Determination of the chemical resistance and electrochemical properties of steels in corrosion-fatigue test samples

SOURCE: Fiziko-khimicheskaya mekhanika materialov, v. 1, no. 5, 1965, 592-595

TOPIC TAGS: corrosion resistant steel, corrosion resistance, sea water corrosion, fatigue test, electrochemical analysis

ABSTRACT: The authors describe an assembly designed by them for automatic measurement and recording of data required in determining the corrosion resistance and the electrochemical properties of materials in a medium used for fatigue tests. The requirements for the determination of the chemical resistance are: 1) the technologic history and the treatment given to the samples being studied should be identical to that of corrosion-fatigue test samples, and 2) the method should be a fast one. The method used is based on the determination of the current of self-diffusion i_0 ma/cm² along the polarizing curves, employing samples prepared for corrosion-fatigue tests (e.g., on the NU machines); the "differential polarization" principle is applied according to G.V. Akimov (Teoriya i metody issledovaniya korrozii metallov, Izd. AN SSSR, 1945.). The polarization curves presented show that the corrosion

Card 1/2

L 10269-66

ACC NR: AP5028377

of SN3 steel, for example, proceeds with considerable anode control due to the intensive passivation of the surface. It is caused by the presence of molybdenum in the steel (3.14%), decreasing the depassivation effect of the chlorions. Anode control is less pronounced in the corrosion of Kh17N2 steel, and almost disappears in steels No. 45 and ShKh15. In the latter case the corrosion process is determined by the concentration of oxygen in the medium. Therefore, the results of the corrosion-fatigue tests will depend on the methods of admission of the medium to the sample. In the experiment conducted the fixed potential of SN3 steel was 175 mv more positive than that of Kh17N2 steel, and 230 mv more positive than of steel No. 45, which also testifies to the increased thermodynamic resistance of SN3 steel to sea water corrosion. The assembly described makes it possible to perform investigations of electro-chemical reactions in samples made of structural steel without external load and under conditions closely approximating those of corrosion-fatigue tests. Orig. art. has: 3 figures and 4 formulas.

PURPOSE: This book is intended for workers in the welding industry.

COVERAGE: The book contains a discussion of welding techniques and problems by
groups of scientists and welders. Much attention is given to problems in the
application of new methods of mechanized welding and electric-arc welding.
This is the second collection of articles under the same title previously
published by the Institut elektrosvaril'nykh splozhnykh Ye. O. Paton (the Institute of
Electric Welding Ye. O. Paton). The previous one was written by Ye. O. Paton,
Academy of the Ukrainian Academy of Sciences and Winner of the Lenin Prize.

AUTHOR: Ponomarenko, I. N. 50-58-3-21/22

TITLE: Scientific Seminar for Operational Sections of the Hydrometeorological Service (Nauchnyy seminar v operativnykh podrazdeleniyakh gidrometeorologicheskoy sluzhby)

PERIODICAL: Meteorologiya i Gidrologiya, 1958, Nr 3, pp. 69-70 (USSR)

ABSTRACT: The arrangement of scientific seminars in the technical subdivisions of the hydrometeorological service - weather bureaus, hydrometeorological bureaus etc., is of special importance for the direct contact between the collaborators of research stations and experts which occupy themselves with the practical work of the hydrometeorological care of national economy. From October 22 to 24, 1957 such a seminar was held in the hydrometeorological bureau in L'vov in the presence of representatives of the L'vov State University and the meteorological service of the L'vov Railroad Office. Six lectures were held. I. N. Ponomarenko, in his lecture characterized the scientific research works which have been performed in the division for the synoptical investigations and forecasts within the entire period of the existence of

the Ukrainian Scientific Research Institute for Hydro-
meteorology, I. V. Koshelenko, N. M. Gavrilenko and N. M.
Volevakha in their lectures dealt with perfected forecasts
on fog and low clouds, on deterioration of the sight in
snow-storms and snow-falls, and on precipitations of various
phase states (in the cold half-year). A. I. Romov in his
lecture treated peculiarities of the influence of the
Carpathians upon the modification of the atmospheric pressure
on both sides of the mountain range and the gradual develop-
ment of orographic precipitations by the displacement of the
south cyclones. N. I. Astakhova reported on scientific
research works for the **perfecting** of long term weather
forecasts which were performed in the Central Institute for
Weather in the Geophysical Main Observatory in the Arctic
Institute and in the **Kazakh** Scientific Research Institute for
Hydrometeorology. The participants in the seminar were uni-
animous on the expediency and the usefulness of such seminars.

AUTHOR: Gavrilenko, N.M.

TITLE: Use of atmospheric circulation indices in the study
of synoptic processes over Ukraine

PERIODICAL: Referativnyy zhurnal, Geofizika, no.8, 1962, 41-42,
abstract 8 B 296. (Tr. Ukr. n.-i. gidrometeorol. in-ta,
no.27, 1961, 3-14).

TEXT: Calculations of the zonal (I_z) and meridional (I_m)
indices of atmospheric circulation of A.L. Kats from January to
April 1941-1959 in a zone contained between $40-70^\circ$ lat.N. and
 $0-60^\circ$ long.E. showed that the average resulting index of the south
and north components of the meridional circulation is in January
- 0.20; in February - 0.10; in March - 0.27 dkm per equatorial
degree. In low latitudes the amplitude of I_z oscillations
increases from winter towards spring, while the reverse is true
for I_m . The amplitude of the I_z oscillations in higher latitudes
is greater than in lower, while the I_m is smaller. In the spring,
with the increasing latitude there is also a decrease in the
amplitude of I_z , and increase in the I_m amplitude. In order to
Card 1/3

Use of atmospheric circulation ... S/169/62/000/008/045/090
E202/E192

characterise the processes at the south of the European synoptic region, values of circulation indices over the surface bounded by 50-60° lat.N, and 0-60° long.E, are used. In order to find quantitative indicators characterising the position of the planetary height of the frontal zone (PHFZ), a comparison of the intensities of the interzonal transfer with the position of PHFZ with the deviations of indices from the average values taken over a number of years was carried out. Analysis of periods in which the values of I_z were close to normal allowed determination of the character of the changes of the barometric field during the changes of I_m . Analysis of cases in which I_m was almost normal and I_z was changing was also undertaken. Various combinations of I_m and I_z led to isolation of 9 different types of processes. During the winter most frequently were repeated the processes of meridional transfer. Repetition of processes with sharply expressed meridionality and weakened zonality reaches 62.9%. Peculiarities of the field AT-500 and average positions of PHFZ in processes characterised by different combinations of I_m and I_z are discussed. Qualitative characteristics of atmospheric circulations in the zone

Card 2/3

Use of atmospheric circulation... S/169/62/000/008/045/090
E202/E192

50-60° lat.N, and 0-60° long.E, may be used to describe the processes depending on considerable monthly anomalies of air temperature during the winter, processes causing sharp cooling and thawing weather, and also for studies of the progress in the transformation of atmospheric circulation over Ukraine. Integral curves for the course of I_m and I_z in the cases of the abnormally cold winter of 1953/54, abnormally warm winter of 1957/58 and the autumn periods preceding these winters, point to the reversed course of the I_z curves (considerable weakening of the zonal transfer during the winter 1953/54 and strengthening during the winter 1957/58), and to the substantial differences in the courses of the I_m curves. This verifies the possibility of establishing forecasting links between the components of atmospheric circulation and the course of the meteorological elements.

TITLE: Vertical distribution of air temperature and humidity in the zone of warm fronts over the Ukraine

SOURCE: Kiev. Ukrainskiy nauchno-issledovatel'skiy gidrometeorologicheskiy institut. Trudy, no. 43, 1964. Voprosy: sinopticheskoy i dinamicheskoy meteorologii (Problems in synoptic and dynamic meteorology), 120-125

TOPIC TAGS: atmospheric front, air humidity, air temperature, atmospheric warm front, cloud formation

ABSTRACT: The purpose of this study was to determine the characteristics of the vertical distribution of air temperature and humidity in the zone of warm fronts over the Ukraine. Since, in the warm season of the year, these fronts are poorly developed during passage over the Ukraine, the study has been limited to an investigation of warm fronts moving in different directions in the cold season. Winter and spring data are compared. Taking into account that physical geography affects the distribution of meteorological elements in the warm front zone to a considerable degree, especially with height, the study was limited to two stations: Kiev and Khar'kov, situated at the same latitude, in the same physico-

geographic zone, but 400 km apart. Cases of the passage of a warm front over the mentioned stations or within 50 km from them were selected from weather charts. A total of 336 such cases for the period January-May 1957-1961 were selected. The authors present considerable data on the characteristics of warm fronts in the Ukraine during the mentioned months. In the zone of a warm front moving in the lower kilometer layer there is either an inversion or a slow temperature drop with height when the moisture content of the air is high. In the warm air mass above a warm front the temperature decreases uniformly with height, regardless of direction of movement of the front. Variation of relative humidity with height is not identical under different synoptic conditions, and is in all probability evidence of a different thickness of the frontal clouds. Orig. art. has: 1 figure and 3 tables.
