Abstract : striction became more pronounced when 1:10,000 - 1:5,000 concentrations were used. Digalen-neo caused a stronger coronary constriction than digicilen. When atropine, in a concentration of 1:50,000 - 1:100,000 was added to those preparations, coronary constriction was prevented. In certain instances a coronary vasodilatation was observed. In the second series of experiments, performed on functioning hearts of cats and rabbits, digalen-neo and digicilen, in a concentration of 1:25,000 - 1:20,000, caused a weak coronary vasoconstriction which with an increase in concentration (1:10,000 - 1:50,000) became pronounced. There was a simultaneous prolongation of the systole and slowing of the rhythm. Digalen-neo had a greater effect than digicilen.

TITLE: Relationship between synoptic processes in the Arctic and some varieties of forms of atmospheric circulation

SOURCE: Leningrad. Arkticheskiy i antarkticheskiy nauchno-issledovatel'skiy institut. Trudy\*, v. 255, 1963. Sbornik statey po voprosam dolgosrochnykh prognozov pogody\* dlya Arktiki (Collection of articles on the problems of long-range weather forecasting for the Arctic), 184-191

TOPIC TAGS: arctic meteorology, weather forecasting, long-range weather forecasting, atmospheric circulation

ABSTRACT: An allowance for forms of atmospheric circulation and their transformations in long-range weather forecasts for the Arctic makes it possible to analyze and predict Arctic processes against the background of macroprocesses in the northern hemisphere. In this paper, the authors consider this problem using as an example two varieties of the forms of atmospheric circulation defined by Vangengeyn. The varieties analyzed were St IV (stationary - type IV) in the E form (for summer and autumn) and Lp11a (Lapland 1a) in the C form (for autumn). The variety St IV is characterized by a stationary anticyclone centered over the  
Card 1/2

L 41146-65

ACCESSION NR: AT4048800

Ukraine. This facilitates the penetration of cyclones into the Arctic, bringing relatively warm air masses from the North Atlantic. The variety Lpl Ia is characterized by the intrusion of cold air masses across Scandinavia and the northern part of the European SSSR into the temperate and southern latitudes of the European SSSR and Western Siberia. Both these varieties can be encountered frequently in E and C forms of circulation. The study was based on charts of the mean pressure field and of the kinematics of natural synoptic periods, daily synoptic charts, meteorological tables of observations by polar stations, charts of pressure patterns at the 500-mb level and catalogues of the circulation forms and types of processes in the Arctic. Data for 1939-1960 were used. The authors discuss the character of development of processes over Eurasia and in the Arctic for the selected varieties and also in the three natural synoptic periods following them. The analysis shows that the Vangengeym varieties of forms of circulation can be used in determining the circulatory relationship between processes in the Arctic and in the temperate zone of the Atlantic-European sector. "Investigating the Temperature Dependence of a Potential Jump (Surge) at the Electrode in Cuprous Oxide," G. M. Abdullayev, Inst of Phys and Math, Acad Sci Azerbaydzhan SSR

"Iz Ak Nauk, Ser Fiz" Vol XVI, No 2, pp 225-226

Exptl research of high-tension polarization in hole semiconductors, cuprous oxide and selenium, at temp of liquid air was performed by V. I. Lyashenko, G. A. Gedorurus and Z. P. Felvashnikova ("Iz Ak Nauk, Ser Fiz". 5, 641, 1938; 5, 4-5 1941); they found a potential surge at the anode. Author studied this phenomenon at room temp in various elec fields. He found an increasing surge with decreasing temp. Indebted to Kh. I. Amirkhanov.

TITLE: Carbon dioxide-shielded arc welding of steel

SOURCE: Byulleten' tekhniko-ekonomicheskoy informatsii, no. 7, 1966, 5-6

TOPIC TAGS: carbon dioxide, arc welding, shielded arc welding, super-strength steel welding, super strength steel / 28Kh3SNMVFA steel

ABSTRACT: A method of carbon dioxide-shielded arc welding of 28Kh3SNMVFA super-strength steel sheets 2.8 mm thick has been developed and introduced in industry. The method employs a welder equipped with a resistor which makes it possible to adjust the current with an accuracy of ± 2.5 amp. To ensure a satisfactory ductility and adequate strength of the welds, VL-1D (TU582-61) electrode wire 2 mm in diameter is used. At a carbon equivalent of 0.76—0.79 the steel requires no preheating, but at an equivalent of 0.8—0.81, preheating to 100—150C is recommended. Sheets should be butted as close as possible (the gap should not exceed 0.2 mm on a maximum length of 10% of the total weld length) on Kh18N9T steel

backing plate and clamped in a special fixture with a pressure of 256 kg per each clamp, i.e., per 4—5 kg/cm<sup>2</sup> of weld. The edges of the clamps are located 13 mm from the joint, which reduces the hot cracking because at the temperature of hot cracking the weld is under compression. The design strength of welds was tested on high-pressure vessels (211 mm inside diameter and 600 mm long). The welds were stress relieved at 650C and found satisfactory. Orig. art. has: 1 figure. TITLE: Distortion of the shape of an ultrasonic wave of finite amplitude in solids

PERIODICAL: Moscow. Universitet. Vestnik. Seriya III. Fizika, astronomiya, no. 2, 1962, 92-93

TEXT: Experimental investigation of non-linear effects in the propagation of intense ultrasonic waves in solids. A sinusoidal wave with a frequency of 5 Mc/sec is emitted from a piezoelectric quartz resonator plate (X cut, 16 mm diameter). Acoustic contact with the polished end face of a cylindrical rod 16 mm, in diameter, is made through a thin layer of transformer oil. At the other end of the rod is a quartz plate with a natural frequency of twice the emitter frequency, i. e. 10 Mc/sec. The output is filtered and amplified by a resonance amplifier and recorded by a EO-58 (EO-58) cathode-ray-oscillograph. In order to exclude, standing waves, the emitter is pulsed with rectangular pulses of 30-40  $\mu$ sec duration

Card 1/3

B163/B102

and a repetition frequency of 200 cps. Measurements in duralumin and MA-8 (MA-8) alloy proved the existence of non-linear effects. The amplitude of the second harmonic is a function of the rod length. With increasing rod length, the amplitude first rises and later decreases. On application of 1000 v at the emitter quartz the rod length corresponding to the maximum amplitude is 20 - 30 cm. In this case the pressure amplitude ratio  $\alpha = p_2/p_1$  of the second harmonic and the fundamental wave which is a characteristic measure for non-linear effects is of the order of 2 - 3 %. In an aluminum single crystal, the  $\alpha$  value found is 6 times higher than predicted by Riemann's theory if only the non-linearity of the equation of motion is taken into account. This result indicates that the non-linearity of the equation of state plays an important role, too. In some other solids, such as plexiglass and some other glasses,  $\alpha$  was found to be smaller than the theoretical value. Non-linear effects could be observed in longitudinal waves only, and not in transversal waves.

TITLE: Elastic waves with finite amplitudes in solids and lattice unharmonicity

PERIODICAL: Moscow. Universitet. Vestnik. Seriya III. Fizika, astronomiya, no. 3, 1962, 92-93

TEXT: The calculation of  $\gamma/\beta$  by reference to the Born model of a solid is discussed.  $\gamma$  is the "mean" nonlinear coefficient, represented as a linear combination of all nonlinear coefficients in Hooke's law;  $\beta$  is the linear coefficient in Hooke's law. Deviations from this law are due to the nonlinearity of forces exerted by the ions within an ion crystal upon one definite ion. The larger the coefficient of thermal expansion the greater is the nonlinearity of Hooke's law. The deviation from nonlinearity is chiefly due to intercrystalline interaction. The effects of polycrystallicity, crystal defects, etc on Hooke's law are still unexplained.

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 43,  
no. 5(11), 1962, 1592-1599

TEXT: Originally sinusoidal longitudinal ultrasonic waves of sufficient intensity (alternating pressures of the order of 1 atmosphere) are distorted during propagation through a solid. The experimental procedure is the same as in the earlier paper (V. A. Krasil'nikov, A. A. Gedroyts, Vestnik MGU, seriya III, 2, 92, 1962) wherein some of the results of the present paper were prepublished in less detail. The pressure amplitude of the second harmonic increases with the distance from the emitter, attains a maximum, and then decreases due to dissipative losses. This result is similar to what occurs in liquids. The distortion can be explained by assuming deviations from harmonic bonding of the atoms in the lattice. It is shown that the ratio of the  
Card 1/2

Elastic waves of finite amplitude ...

S/056/62/043/005/005/058  
B163/B186

coefficients in the quadratic and the linear term in the equation of state for the solid body can be determined from the measured relative pressure amplitude of the second harmonic with respect to the pressure amplitude of the fundamental frequency. This ratio is measured for Al single crystals, NaCl, KCl, LiF, and the Mg-Al alloy MA-8 (MA-8). The given values are in good agreement with the experimental results which Bridgman et al. obtained from static measurements under pressure from all sides. There are 3 figures and 1 table. ✓

TITLE: Shear waves of finite amplitude in poly- and single metallic crystals

SOURCE: AN SSSR. Doklady, v. 150, no. 3, 1963, 515-518

TOPIC TAGS: transversal waves, ultrasonics, Hooke's law, longitudinal ultrasonic waves, magnesium-aluminum alloy MA-8, aluminum, duraluminum, zinc, cadmium, shear nonlinearity

ABSTRACT: In several previous papers the authors have investigated the nonlinear distortion of longitudinal ultrasonic waves (deviation from Hooke's law). The present paper deals with the nonlinear distortions in the shear wave which are much smaller. The experimental work was done on polycrystalline metals (magnesium-aluminum alloy MA-8, aluminum, and duraluminum) and on single crystals of aluminum, zinc, and cadmium. The distortion was observed by the appearance of a second harmonic. For detection, the usual ultrasonic equipment was used. Effects of small load and short heating are described. It was found that the shear nonlinearity in single crystals is very sensitive to small loads and to heating. It is believed that this sensitivity is partly due to dislocations. TITLE: **Methods of Making Drawings of Standard Parts and Products (Sposoby vypolneniya chertezhey normal'nykh detaley i izdeliy)**

PERIODICAL: Standartizatsiya, 1957, # 6, pp 73 - 77 (USSR)

ABSTRACT: As is known from the practical experience of plants, scientific institutes and central normalizing designing bureaus, a "normal"-standard is always accompanied by sets of drawings. These drawings have to be worked all over in the current normalization campaign, and their number must be reduced.

The Plant Uralmashzavod has solved the problem by "table drawings". This is a drawing of only one machine part (spring, sealing, bushing, etc.) accompanied with a specification in the form of a table - on the same drawing sheet - for all other normalized sizes of this part. The designer can choose the part of the necessary size and enter its designation into new specifications and drawings.

The new procedure has greatly reduced the quantity of drawings and the cost of designers work.

There are 6 figures.
