**Selection of the Type of Heater for High-Viscosity Fuels**

heater and the cracking residue is given in Eq (2). It will be seen that the agreement between theoretical and the test results is good. Graphs of the total hydraulic resistance of the heater and cooler as functions of the flow of cracking residue are given in Fig 6. The resistance, of course, is considerably higher when the equipment is used as a cooler. Tests made to determine the decrease in the hydraulic resistance as the material heated up gave the results plotted in Fig 7. Fig 8 shows experimental curves of the resistance of straight sections of pipes as functions of the flow and also theoretical results calculated from Mikheyev's formula: it will be seen that the agreement is very good. Calculated and theoretical values of the coefficient of friction are compared graphically in Fig 9: indicating that 36% of the test results lie within 2% of the theoretical line. The heat-transfer rate of the heater can be much increased by using slightly super-heated steam under pressure. With this type of heat exchanger there is practically no risk of the fuel getting into the steam and so the condensate can be used for boiler feed.

Card 3/4

SOV/96-59-5-7/19

Selection of the Type of Heater for High-Viscosity Fuels

Comparative characteristics of the old and new types of oil heater are given in Table 3, which relates to operating data from a power station. The new heaters are cheaper, smaller and more efficient. At present, heaters of the new type are being installed in a number of power stations. There are 9 figures, 3 tables and 5 Soviet references.

**AUTHORS:** Volkov, N.F., and Geller, Z.I.**TITLE:** Some Features of Heat Exchange in the Fire-Boxes of Tubular Furnaces and the Distribution of Radiant Flux over the Baffles (Nekotoryye osobennosti teploobmena v topkakh trubchatykh pechey i raspredeleniye luchistykh potokov po ekranam)**PERIODICAL:** Khimiya i tekhnologiya topliv i masel, 1959, Nr 7, pp 38-47 (USSR)**ABSTRACT:** After discussing some published work on radiant heat transfer in tubular furnaces the authors describe their own tests on three heating furnaces in the oil industry. These were a two-chamber, double-flow furnace (Fig 1) and type R-1 (Fig 2) and N-1 (Fig 3) single-chamber furnaces. The respective fire-box volumes were 404, 206 and 340 m<sup>3</sup>. Table 1 gives design details. The authors used VNIIT low-inertia two-sided radiometer-heat probes for measuring local fluxes and also compiled heat balances (Table 2). Thermal fluxes at a constant firing rate were found to be substantially influenced by numerous factors. The relation between radiant flux and total heat output per unit volume of firing box varies for furnaces of different designs. In the furnaces

Card 1/3

SOV/65-59-7-9/12

Some Features of Heat Exchange in the Fire-Boxes of Tubular Furnaces  
and the Distribution of Radiant Flux over the Baffles

investigated, the distribution of flux between baffles was very uneven, even taking the average of several determinations; a six-fold ratio between maximum and minimum thermal stresses in baffles was observed in some tests. Aerodynamic factors caused a characteristic distribution of radiant flux (Fig 4) in one of the furnaces (Fig 1). Distribution of thermal flux over a roof baffle is shown in Fig 5. Tests were carried out with burners switched off at various points: greatest uniformity of incident radiant flux was obtained when the burner nearest the baffle was turned off (middle graph of Fig 6, which shows frequency curves for flux intensities). Deposits on the baffles and tubes caused further non-uniformity and led to scatter of experimental points on a graph of roof baffle thermal efficiency as a function of incident radiant flux. The outside deposit surfaces of tubes were found to be 300 - 350 °C hotter than the product being heated, which must greatly restrict the role of convective heat transfer; on the other hand, the authors conclude that the effect of baffling on radiation factors has been

Card 2/3

SOV/65-59-7-9/12

Some Features of Heat Exchange in the Fire-Boxes of Tubular Furnaces  
and the Distribution of Radiant Flux over the Baffles

exaggerated (Refs 2, 5). To obtain greatest uniformity  
in the firing box a cascade control system should be used.  
For measuring the thermal load on a baffle the authors  
favour the direct measurement of incident radiation with  
a radioactive probe (Fig 8). An editorial note invites  
further contributions on the subject.

Card 3/3 There are 8 figures, 2 tables and 10 Soviet references.

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Energetika,  
1960, Nr 3, pp 143-150 (USSR)

ABSTRACT: This gives a method of calculating the flow coefficient  
of nozzles used in boiler installations in relation to  
the construction of the nozzle and experimental data  
on the angle of the jet. G.N. Abramovich and L.A.  
Klyachko had previously described the operation of  
nozzles, but the ones they dealt with differ from those  
used to spray fuel in boiler installations. To find a  
method for calculating the flow coefficient and obtain  
data on the angle of the jet, the author carried out  
experimental investigations into the hydraulic charac-

teristics of nozzles, shown in Figures 3, 4 and 5, used in boiler installations. Figure 2 shows the circulation apparatus which was used. Fuel consumption was determined by a measuring tank. Pressure before the nozzles was measured by a reference manometer. Viscosity of the fuel was varied by heating. The results of the tests are given in the form of graphs and compared with those obtained by previous investigators. Figure 1 also shows graphs for the relationship of the flow coefficient to geometrical characteristics, calculated according to the methods of V.I. Skobelkin, and D.I. Taylor, and which hardly differ from the graph given in [Ref. 3]. Figures 3, 4 and 5, besides showing the flow coefficients, also give the experimental data on the angles of the jet, which differ from those obtained by calculation [Ref. 3]. There

137, abstract 12B927 (Tr. Groznensk. neft.  
in-t, 1960, no. 24, 146-165)

TEXT: A detailed review is given of the existing methods of viscosity measurement of flowing liquids. All the existing continuous flow viscosimeters are divided into five classes: capillary, rotary, possessing the rotor, based on the falling sphere method and on the intensity of damping of elastic oscillation in a viscous fluid. For each class, a thermodynamic equation used for viscosity determination is given, as well as a description of the apparatus, working procedure, and applicability of various instruments with comparative assessment of

TITLE: An equation for calculating the heat conduction of petroleum products

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 22, 1961, 392, abstract 22M67 (Tr. Groznensk. neft. in-t, v. 3, no. 25, 1961, 85-96)

TEXT: A survey of theoretical and empirical equations for calculating the heat conduction of petroleum products is presented. A comparison of experimental and calculated data shows that the equations published in the literature lead to considerable errors when calculating the heat-conduction coefficient,  $\lambda$ , of petroleum products. Empirical equations obtained by generalizing the experimental data of various scientists are suggested for the determination of  $\lambda$  of petroleum products. These equations make possible  $\lambda$  determinations between -40 and +250°C with an error of 9.5-10.5% for petroleum products having  $\gamma_4^{20} = 0.75-1.06$ . The calculations proved that petroleum products are nonassociated liquids. The equation by Predvoditelev - Vargaftik describes the temperature dependence of the

TITLE: Solution of heat problem with moving boundaries expressed by  $\beta\sqrt{t}$  B

SOURCE: Inzhenerno-fizicheskiy zhurnal, no. 9, 1964, 57-63

TOPIC TAGS: heat conduction, error function, Maclaurin series, convergence test

ABSTRACT: The solution of heat conduction problems with movable boundaries expressed by the one-half power law,  $\beta\sqrt{t}$ , is discussed. Three different cases are considered: (1) heat conduction in finite as well as semi-infinite regions for a boundary condition of first kind, or

$$\left. \begin{array}{l} u_1(0, t) = \varphi_1(t) \\ u_1(\beta\sqrt{t}, t) = u_1(\beta)\sqrt{t}, t = \psi_1(t) \end{array} \right\} 0 < t < +\infty,$$

$$u_1(x, 0) = 0, 0 < x < +\infty;$$

(2) heat conduction in finite region with boundary conditions of second kind

Card 1/3

L 10422-65

ACCESSION NR: AP4047441

$$u(x, 0) = 0, \quad 0 < x < \beta\sqrt{t},$$

$$u(0, t) = \psi_1(t)$$

$$\left. \frac{\partial u(\beta\sqrt{t}, t)}{\partial x} = \psi_2(t) \right\}, \quad 0 < t < +\infty,$$

and (3) boundary conditions of the fourth kind

$$u_1(0, t) = \psi_1(t), \quad 0 < t < +\infty;$$

$$u_2(x, 0) = 0, \quad 0 < x < +\infty;$$

$$u_1(\beta\sqrt{t}, t) = u_2(\beta\sqrt{t}, t);$$

$$\lambda_1 \frac{\partial u_1(\beta\sqrt{t}, t)}{\partial x} = \lambda_2 \frac{\partial u_2(\beta\sqrt{t}, t)}{\partial x}$$

In all above cases  $\psi_1$  and  $\psi_2$  (arbitrary functions of time) are expanded in MacLaurin series, and the series solutions are given in terms of the complementary error functions

$$(40) I^m \operatorname{erfc} \frac{x}{2a_i\sqrt{t}}, \quad i = 1, 2$$

Geller, Zinoviy Isaevich

Mazut used as fuel (Mazut kak toplivo), Moscow, Izd-vo "Nedra", 1965, 494 p. illus., biblio. 5,000 copies printed. Combustion, petroleum, petroleum fuel.

TOPIC TAGS: fuel property, industrial furnace

PURPOSE AND CONTENT: This book describes the composition and properties of high-sulfur and high viscosity mazuts used in boiler and furnace fuels. Also presented are means of fuel supply, preparation of fuel for burning, and several questions on the technology of heating processes (diffusion, burning, radiant heat regime, contamination and corrosion of the heating surface) while burning mazuts in boiler furnaces and technological furnaces of petroleum processing factories. The book is recommended for technical engineers studying, planning or using thermal electric stations, production and heating boilers, heating and technological furnaces of industrial plants and petroleum industries. It can also be useful for students and aspirants specializing in thermal energy and associated fields.

*Gellér Sándor, Éghajlatkutatók expedíciója a Kaspiai-tó környékén [Climate  
logical expedition to the plains near the Caspian Sea.] Tervszövetségi Technika, Budapest,  
111(7):445-446, July 1952. DLC—Description of activities and preliminary results of an  
expedition organized by the Russian Academy of Science. Purpose of the enterprise was to  
investigate physical properties and effects of "sukhovet," the parching wind of the Caspian  
plains. To this end air and soil temperature, humidity, wind and evaporation measurements  
were made in the desert east of Stalingrad. Anemometer and electric thermometers were  
placed on high poles. Among other instruments the author describes the "spider thermocouple"  
(an electric device developed for measuring soil surface temperature), the "thermomefer  
sonde" (a metal rod provided with an electric meter for measuring soil temperature to a depth  
of 1 m) and a novel type evaporimeter. Subject Headings: 1. Expeditions 2. Dry winds  
3. Micrometeorological instruments 4. Sukhovet 5. Kazakhstan. U.S.S.R.—G.T.*

Some data on the mechanism of mineral nutrition of plants by adsorbed ions. Ya. M. Hellerman (Timirazev Agr. Academy). *Compt. rend. Acad. sci. U.R.S.S.* 55, 543-6(1947)(in English).—In expts. in which plants were grown in nutrient solns. with and without activated carbon, more Ca, P, and Cl were taken up in the presence of the carbon. It is suggested that accumulated org. substances around the roots, root secretions and intermediate products of their decomps. by bacteria, are adsorbed by the carbon; this frees the active adsorbing surface of the roots. The presence of materials in soils capable of adsorbing org. substances probably similarly improves the mineral nutrition of plants. Lawrence P. Miller

*C. A.  
RELEASED BY A.M.*

*Effect of decomposition products of organic substances on root nutrition of plants. Ya. M. Galazey, D. Dabady, Akad. Nauk S.S.R. 73, No. 6 (1960). - introduction of 1-20 millimoles/l. of AcOH, PrCOOH, EtOH, or BuOH into the Kino<sub>4</sub> nutrient mist led to the following results with corn plants, grown in sand culture. Plant growth was retarded, although the pH of the medium was unaltered. AcOH and PrCOOH increased the amt. of labile Al; this may have affected availability of phosphate. Apparently EtOH and BuOH are oxidized by the soil bacteria to the acids which increases mobile Al concn. These conclusions are verified by expts. with Krasnozem soils; both Al and FeO in labile form are increased by incubation of the soil with aq. solns. of glucose; the aq. ext. added to known phosphate soln. lowers the amt. of available phosphate.*

of the Walls of the Lymph Vessels. I. Histologic  
Structure of the Walls of the Thoracic Duct.

Orig Pub : Kiserl. orvostud., 1957, Vol. 9, No. 3, 309-315

Abstract : Studies were made of the structure of the wall of  
the thoracic duct (TD) of man and of various ani-  
mals. Depending upon the peculiarities of struc-  
ture of the wall of the TD, three types could be  
distinguished: a muscular-collagenous-fibrous  
(man, sheep); a muscular-elastic-fibrous (ox, pig);  
a TD poor in muscular fibers (dog, cat, rabbit).

The enclosure of the TD by 3 membranes is possible only with the first and second types. The wall of the TD thins out in the proximal direction, chiefly because of the reduction in the number of muscular elements; in the contrary direction, there is an especially marked increase in the thickness of the circular musculature. -- A. V. Kuz'mina-Prigadova

Abstract: [Authors' Hungarian summary] By the method of experimental lymphatic edema produced by "self-injection with lymphatic fluid," the lymphatic vessels in the substance of the dura mater at the skull base and their connection with the cervical lymphatics were demonstrated. In contrast to the uncertainties and inadequacies found in the literature, this paper provides a morphological confirmation of the lymphatics in the area of the dorsal sulcus and also explains the severe morphological and functional changes seen after radical ligation of the cervical lymphatic ducts. TITLE: The Introduction of the Gang Machining of Parts at the Heavy Machinery Plants of the Mosoblssovarkhoz

PERIODICAL: Byulleten' tekhniko-ekonomicheskoy informatsii, 1960, No. 8, pp.71-72

TEXT: The Tekhniko-ekonomicheskiy sovet Moskovskogo oblastnogo sovnarkhoza (Technical and Economic Council of the Moscow Oblast' Sovnarkhoz) discussed the practice of introducing the gang machining of heavy machinery parts at the Kolomenskiy zavod tyazhelogo stankostroyeniya (Kolomna Plant of Heavy Machine Tool Construction) and at the Elektrostal'skiy zavod tyazhelogo mashinostroyeniya (Elektrostal' Plant of Heavy Machinery). The production of the Kolomna Plant is characterized by the variety of machine tools and presses being manufactured and the great number of parts being used for every machine, i. e., more than 2,000 items per machine. 400 standardized technological processes have been developed for 40,000 items, seven specialized sections for the gang machining of parts in a technologically closed production cycle have been established. As a result of these measures, labor productivity increased on an average by 20-22%, while the

The Introduction of the Gang Machining of Parts at the Heavy Machinery Plants of  
the Mosoblssovmarkhoz

volume of manual and transport operations was reduced by 2-2.5 times. At these sections, multipurpose assembly fixtures and jigs are used which yield annual savings of 900,000 rubles. The total labor consumption for the manufacture of each machine was cut by 4,000 norm-hours. At the Elektrostal' Plant of Heavy Machinery, where individual production features prevail, machine parts and units have been unified and standardized, technological processes typified, and, based on these preparations, sections for the gang machining of parts have been established. As a result of these measures, labor consumption was reduced by 30%.
